# INSECTA BRITANNICA.

## D I P T E R A.

VOL. III.

BY

FRANCIS WALKER, F.L.S.

LONDON :

LOVELL REEVE, HENRIETTA STREET, COVENT GARDEN.

1856.

JOHN EDWARD TAYLOR, PRINTER,  
LITTLE QUEEN STREET, LINCOLN'S INN FIELDS.

## P R E F A C E.

---

IT was originally contemplated to give a complete enumeration, with descriptions, of the British DIPTERA in three volumes, of which the present is the last, and a general Introduction was promised therewith. But, as has been already explained in the Preface to the second volume, the matter was found so much more extensive than had been calculated, that it became necessary to omit a large proportion of the recorded British species, and many of the genera in the vast Family *Muscidæ*. It would require a fourth volume to develope the work with the degree of completeness originally proposed; and as there is now a prospect that the Publisher may be encouraged to offer such a supplementary volume by Mr. Haliday, it has been thought better to reserve the general view and illustrations of the Order for the conclusion, and thereby to give more space for the treatment of the Families remaining for the present volume, and for additions to the plates, and to the text, illustrative of those treated of in the preceding two. A complete enumeration of the known British species not described in these three volumes would have occupied more space than could be spared for the purpose. The additions therefore have been limited to a notice of the genera omitted, including the reasons for the exclusion of some few that appear

in the previous lists of British DIPTERA. It has not been thought necessary to enumerate the genera which Macquart and Desvoidy have formed as dismemberments of those of Meigen, nor yet certain others, the representatives of which will be found included in the greater genera from which they were taken, as the collective index of generic names and synonyms will direct the student to these, and the complete Systematic Index is reserved for the Supplement. As the sheets up to the end of the index to this volume have been printed off several months since, it was not practicable to incorporate the first list of Errata. The Addenda and Corrigenda, and the general observations, have been kindly prepared by Mr. Haliday; and Mr. Westwood has supplied two supplementary plates of generic illustrations instead of two drawn by Mr. Haliday, to illustrate the venation of the wings and the nomenclature adopted for the veins and areolets, which also will find a place in the Supplement.

FRANCIS WALKER.

*February, 1856.*

---

The reader is requested to bear in mind that the Analytic Tables, whether of families, genera, or species, are intended to apply only to the British species described in these volumes, and that a more extended application of them would be liable to lead into error in several instances. The change of plan, adopted at the very conclusion of the present volume, having caused the Errata to be dispersed in several lists, it is recommended carefully to note all the corrections from these in the text.

A. H. H.

## ADDENDA AND CORRIGENDA.

---

### VOLUME I.

Page. Line.

5. 12. Some female *Ceratopogones* have the ungues unequal.
6. 19. *for costale* read *costali*.
7. Analytic table. The posterior continuation of the costal vein is so faint in many *Cecidomyzidæ*, that they might be sought for under the preceding embranchment. They may be distinguished from the *Chironomidæ* there, by the uniform flagellum of the antennæ, the terminal joints of which in the *Chironomidæ* (one or more), tend to form a club, by their disproportionate length or thickness. The veins of the wings also, in the *Cecidomyzidæ*, are usually fewer, and the membrane more hairy.
8. Analytic table. The bifurcation of the cubital vein in the *Stratiomidæ* is not universal, and this discrepancy affords a primary character for the subdivision of the genera *Stratiomys* and *Oxyccera*. The table is so framed as to leave the genera *Myopa* and *Zodion* with the *Muscidæ*, in accordance with R. Desvoidy's arrangement (*Myodaires*). More lately (*Myopaires*, 1853), he has himself abandoned this conjunction, and admitted them as a distinct family, after the example of Macquart. From the *Muscidæ* they are definitely separated by the oblique direction of the humeral suture of the mesonotum, in this as well as in general habit, agreeing with the *Conopidæ*. Their internal anatomy is equally conformable, as demonstrated by Dufour (*Mém. Pres. Acad. Fr. xi.*), and their economy also, according to the observations of Von Heyden, in the *Isis*, 1842.
17. *dele* 7. *connexa* (Not in Mr. Stephens' collection, probably not European.)
21. 31. A variety, with clear yellow for the ground-colour, represents *Musca hy-poleon* of the Linnean collection; *see E. Z. xii. 1851. p. 137.*
23. 28. *for Hal. MSS.* read *Dale, A. N. H. viii. (1841).*
24. 21. *after Shr.* add *coccinea*, *Fb.*; *Vill.*
31. 26. add *cærulescens*, *Vill.*
42. 17. add *crassicornis*, *Wlbg.*; *Ztt.*
77. 40. *for lacchus* read *iacchus*.
83. *read* 1. *pulicaria*, *Mk. m. b. 58. 14 (1796)*, etc.  
*dele* *gibbosa*, *Ol.*, which is probably a species of *Geron*.
88. The genus *Gloma* has been introduced into the British lists on the authority of Stephens' Systematic Catalogue, but in his collection it is represented by *Sciodromia immaculata*. The generic name *Wiedeman-nia* is preoccupied in botany, and both this and *Heleodromia* might well be merged in *Clinocera*; *see Scholz, Schlesische Entomologische Zeitung*, 1850, No. 16.
105. 9, 10. *for 1 read 2, and vice versd.*
107. 10. *for lotæ read lota.*
133. 30. *add* Not rare at Holywood (J.)
136. 40. *add femorata* (*Hemerodromia*), *Ieeger! Sitz. Wien. Akad. ix. (1852).*
147. 29, and page 236, line 13, *for 1782 read 1776.*

## Page. Line.

149. 8. add Heeger has lately illustrated the transformation of *Rhaphium fuscipes*, Sitzungsberichte der Wiener Akademie, ix. (1852).
165. 31. add *pallidicoxa*, Roser. Note. Zetterstedt, D. S. p. 4294, has described the male of his *D. parvulus*, establishing the correctness of the identification in the text.
167. 34. add *pictipennis*, Wlbg; Ztt. Note. The female has immaculate wings; see Ztt. D. S. p. 4280.
175. 18. insert 42\* *prætextatus*, Hal. N. H. Rev. ii. 63 (1855).
179. *D. alutifer* is better placed in g. *Porphyrops*, q. v.
180. 38. add *Aphrozeta*, Perris, Annales de la Socie. Linn. de Lyon, A. D. 1852.
186. 15. add *semiglaucus*, Perris. Oeours also on the sea-coast. (1.)
187. 1. add *cinereus*, Perris?
190. 33. add *pictipennis*, Bohemann; Ztt.
193. 9. Bohemann, Act. Holm. 1851. p. 194 (1853), has described the male, which has the face narrower, the hypopygium small, with slender, filiform appendages.
195. 27. add *pygmæum*, Ztt. D. S. p. 4618 (1855).
204. 25. add In September, about Blarney Lake. (1.)
206. 12. The name *Machærium* has been long preoccupied in botany, and it does not seem necessary to propose another to replace it, until the genus *Rhaphium* be definitely circumscribed; with which the species *mari-*  
*time* may well remain united meanwhile.
212. 42. insert 5\*. *cretifer*, Wlk. C. D. B. M. p. 653 (1849); *alutifer* (Dol.)  
1. B. D. i. 179. Note. The colour of the tarsi of the male, to which the trivial name alludes, was not noticed in the earlier description.
214. 20. read Very common. (E. S. 1.)
214. last line, read Not rare on the seacoast. (E. I.)
214. insert 12. *muralis*, Mg. Zw. iv. 62. 5 (1824).
216. last line, add The wings are incurved in repose, which character alone is sufficient to take this group out of the definition of the genus *Chrysotus*.
221. 18. insert 1\*. *celtiber*, Hal. N. H. Rev. ii. 63 (1855).
221. 35. add (I.)
231. 38. Dahlbohm, Act. Holm. Conspl. 1854 (1855), has illustrated the transformation of *P. fuscipes*. The larva inhabits the body of various Homopterous Hemiptera.
234. 8. dele *Sclerostoma*, etc., to end of the line.
234. 9. for *Chetolona* read *Chetoloxa*.
235. 7. for areolet read areoles.
237. The genus *MALLOTA* should have a place here, being represented in the British Fauna by *M. vittata*, Mg. Zw. iii. 378; *ruddii* (*Helophilus*), Ct. B. E. 429; which last has been erroneously cited in the present work as synonymous with *Helophilus lunulatus*. This correction, supplied by Professor Loew, has been confirmed by the collation of a specimen from Meigen's collection, and ticketed by his own hand, in the possession of Mr. Winnertz.
240. 13. add *viridescens*, Vill. iii. 463, 138.
243. *E. fumipennis*, as appears from Stephens' Systematic Catalogue, 288, g. 122, 10, was not captured nor seen alive by himself. It is probably an American insect, allied to *E. vinetorum*, Fb., and *E. uvarum*, Wlk.
249. 30. for luteo-vittato read nigro-vittato.
269. *Psilotia anthracina*. No authentic British specimen: represented in Stephens' collection by species of the genus *Pipiza*.
298. *Melithreptus*. This generic name is preoccupied in ornithology.

## VOLUME II.

Page. Line.

14. *Tachina phalerata*, Mg. Zw. iv. 285, is the type of g. *PLESINA*, Mg. Zw. vii. 214.  
 106. *insert* g. *IDIA*, Mg.—sp. l. *fasciata*, Mg.  
 111. 13. *vitripennis* has been introduced without sufficient authority, as it seems, being represented in British collections by a variety of *M. domestica*.  
 117. The g. *CÆLOMYIA*, Hal. (Wwd. Mod. Class.) is also referable to *ANTHOMYIA* in the wide sense of the text, the type of it being *Aricia spathulata*, Ztt. D. S.  
 146. Here the g. *ERIPHIA* should come in, according to Stephens' Systematic Catalogue, but in his collection it is represented by an *Anthomyia*, Mg.  
 152. *insert* g. *LEPTOPA*, Ztt.—sp. *filiformis*, Ztt.; *flava* (*Cordylura*), Hal.  
 153. running title, for *CORDYLURA* *read* *SCATOPHAGA*.  
 155. *read* 5. *ostiorum*, Hal.; *borealis*, Ztt.; *oceana*, Mcq.?  
 155. *read* 16. *maritima*, Hal.; *marina*, Mcq.  
 156. *insert* g. *THYREOPHORA*, Latr.—sp. *furcata*, Fb.  
 156. 26. add *eximia*, Stnh.  
 157. 3. *read* 1. *simplex*, Hal.; *frigida*, Stnh.  
 157. 4. *read* 2. *parvula*, Hal.; *nitidula*, Ztt.; Stnh.  
 157. g. *MALACOMYIA*, Hal.; *Phycodromia*, Stnh.—sp. *sciomyzina*, Hal.; *fuscorum*, Ztt.; Stahl.  
 160. 32. *read* 6. *schenherri*, Fln. Suppl. (1827); *monilis*, Mg.  
 163. *Heteromyza oculata*, Fln., is the type of g. *THELIDA*, Desv.  
 163. 15. add *Clusia*, Hal.; Wwd. Mod. Class.; *Macrochira*, Ztt.  
 163. 21. add Ztt.; *spurca*, Hal. E. M.  
 167. 20. *read* 5. *albiseta*, Scop. E. C. (1763); *aratoria*, Fb., etc.  
 169. 1. *read* 10. *punctulata*, Scop. E. C. (1763); *hieracii*, Fb., etc.  
 169. 31. *read* 2. *unguicornis*, Scop. E. C. (1763); *pratorum*, Fln.  
 170. 28. *read* 2. *spinipes*, Scop. E. C. (1763); *hafneri*, Fln.; Mg.; Mq.; Ztt.; *ferrugineus*, Dufour; *aquaticus*, Desv.  
 171. 28. *insert* g. *TRIGONOMETOPUS*, Mq.; *Oxyrrhina*, Mg.—sp. l. *frontalis*, Mg.  
 174. 1. *read* 5. *pusilla*, Fln. D. S. (1820); Ztt.; Stnh.; *scabricula*, Hal.  
 179. 35. add Stnh.; *abbreviata* (*Agromyza*), Fln.  
 186. 13. 6. *sordida*, Hal.; *decipiens* (*Sapromyza*), Loew.  
 187. g. *PALLOPTERA*: of the species given under this genus, only sp. 4, 5, 6, 7, 9, 12, belong to it; the rest to *SAPROMYZA*, Fln.  
 191. 14. *read* 12. *Iameda*, Schr. I. A. (1781); Lw.—*pulchella*, Fb.; Mg.; *muslicbris*, Harris!; *fasciata*, Mq.  
 191. 36. sp. 3. *femorella*, belongs to the g. *SCYPHELLA*, Desv. Closely allied is g. *CHIROMYIA*, Desv.—sp. l. *fenestrarum*, Desv.; *consobrina*, Ztt.  
 192. 29. add *maritima*, Ztt.  
 194. 27. The g. *TIMIA* has been introduced into the British list, but the specimens supposed to represent it are *Ulidia erythrophthalma*, Mg.  
 212. 27. add *lucida*, Stg.; Ztt.  
 222. 32. add *pectoralis*, Ztt.  
 229. 41. *read* 9. *lateralis*, Hal.; *scutellaris*, Ztt.  
 229. 42. *read* 10. *fulvifrons*, Hal.; *crythrocephala*, Ztt.  
 229. The g. *HOMALURA* has been introduced into the British lists, on the authority of Stephens' Systematic Catalogue, but the specimens, " *H. tarsata*," in his collection, are *Gymnopa glabra*.  
 235. 10. *read* 2. *sabulosa*, Hal.; *brevipennis*, Ztt.  
 235. *insert* g. *LIOMYZA*, Mcq.—sp. l. *scatophagina* (*Heteroneura*), Flu.

Page. Line.

235. insert g. COLOBÆA, Ztt.; *Geomyza* p., Fln.; *Sciomyza* p., Mg.—sp. l. *bifasciella*, Fln.; Ztt.; *concentrica*, Mg.
236. 15. read l. *fuscula*, Fln. D. S. (1820); *costata*, Mg. (?) ; Ztt. D. S.; *marginella*, Ztt. I. L.; *fulvifrons*, Hal.
236. insert g. AULACIGASTER, Mq. I. D. ii. 579 (1835); Ztt.; *Ampycophora*, Wlbg.—sp. *rufitarsis*, Mq.; Ztt.; *tarsata*, Wlbg.; *ruficeps* (*Notiphila*), Mg.?
236. insert g. CAMILLA, Hal. (Wwd. Mod. Class.); *Drosophila* p., Fln.; Mg.—sp. l. *glabra*, Fln. D. S. Gcom. 8. 12 (1820).
238. 40. read 6. *flaveola*, Mg. Zw. vi. 66 (1830); Perris; Heeger; *flava*, Ct.; *apicalis*, Hardy; *pallida*, Ztt.
239. 22. Belongs to g. OPOMYZA, Mg.; *Leptomyza*, Mq.; *Anthophilina*, Ztt.; see p. 240.
239. insert g. STEGANA, Mg. Zw. vi. 79 (1830); Mq.; Wwd.; Ztt.; *Drosophila* p., Fln.; *Musca* p., L.; Scop.
1. *coleoptrata*, Scop. E. C. 907 (1763); *hypoleuca*, Mg.; Mq.; Ztt.; *annulata*, Hal.
2. *furta*, L. S. N. xii. II. 991. 72 (1767); *curvipennis*, Fln.; *nigra*, Mg.; Mq.; Ztt.
240. insert g. MILICHIA, Mg.—sp. l. *maculata*, Mg., was reared, from larvae feeding on fungi, by the late Miss Knight.
240. insert g. HETERONEURA, Fln.—sp. l. *albimana*, Mg.
247. 38. add The larva mines the leaves of *Populus nigra*.
282. 5. for *galatea* read *galeata*.
289. insert g. OXYPTERUM, Leach (1817); *Anapera*, Mg.—sp. l. *pallidum*, Leach; *hirundinis*, Pz.—2. *kirbyanum*, Leach.

## VOLUME IV.

Page. Line.

- 7. 37. *dele the second* but.
- 7. last line, *for forks read veins.*
- 43. running title, *for TETRAGONEURA read SCIOPHILA.*
- 50. G. *Planetella*, Wwd.; *Planetes*, Wlk., may probably be reduced to *SCIARA.*
- 56. 16. 24. *brevipennis* is a *Campylomyza*, according to Mr. Haliday.
- 62. 34. 5. *globifera*, exemplifies the g. *MICROMYIA*, Rondani.
- 139. 5. The females with black thorax are referred to *B. clavipes*. The males of both are very like each other, but there appears to be a difference in the length of the tarsi, and the diffusion of the stigmatical spot of the wing.
- 254. 25. *for twelve read fourteen.*
- 261. 29. *for 12-articulatæ read 14-articulatæ.*
- 264. 10. Steeger's description of the aquatic larva of *Dixa nigra* seems rather to favour the affinity to the *Tipulidæ*, but is not sufficiently explicit as to some important points to justify a positive conclusion.
- 269. This analytic table was drawn up without reference to two British species, the introduction of which will require certain modifications of it; and as the table was previously affected by a serious misprint, it is given here over again, with these corrections; *see next page.* The species referred to are *Cylindrotoma glabrata*, Mg. (Zw. i. 142, vi. 274), figured in Plate XXVII. fig. 8, and *Limnobia occulta*, Mg., for which see page 302, sp. 48. The latter is the type of the genus *AMALOPIS*, distinguished from the other groups that have been separated from *Limnobia*, not only by the characters of venation specified in the table, but also by the hairy eyes, and by the frontal tubercle, which seems to foreshadow the appearance of ocelli in that region, towards which the subsidiary optic nerves run, in the *Tipulidæ*, although those organs are as yet undeveloped.
- 315. 1. *for venosa read rivosa, and dele F.*
- 341. 30. The trivial name *fenestralis* has the right of priority. *Annulata*, L., is an error of the press in the S. N. for *annotata*; *see Ent. Zeitung*, xii. 1851, p. 135.
- R. *cinctus*, Fb., with which *ochraceus*, Ct., is identical, is considered by Zetterstedt as a distinct species.

Wingless

CHIONEA.

very short, incurved to the anal angle

1. TRICHOCERA.

simple, detached

2. ANISOMERA.

rigid and very short

9. GERANOMYIA.

longer than the rest of the head

8. RHAMPHIDIA.

12-jointed

13. DOLICHOPEZA.

13-jointed

6. DICRANOTA.

extending beyond the anal angle: Extero-medial veins arising from the brachial areolets

remote-monili-form, bipectinate in the male } 10. RHIPIDIA.

compact-monili-form, unbranched in either sex } 5<sup>a</sup>. LIMNOBIA.  
(*Glochina, Mg.*)

distinct : Axillary vein

flexible, usually 4-jointed : Rostrum

4. SYMPLECTA.

shorter than the rest of the head : Antennæ

3. ERIOPTERA.

16- (or 15-?) jointed : Cubital vein

simple: Extero-medial veins ending in  
three: Axillary vein

sinuous  
nearly straight:  
Middle legs

shortest .  
equal

5<sup>b</sup>. LIMNOBIA,  
(*propriæ dictum.*)

four: Pobra-chial areolet

entire  
biseected

5<sup>c</sup>. LIMNOBIA.  
(*Limnophila, Mcq.*)

forked: Discal areolet

none  
one

5<sup>d</sup>. LIMNOBIA.  
(*Idioptera, Mcq.*)

5<sup>e</sup>. LIMNOBIA.  
(*Trieyphona, Ztt.*)

12. PEDICIA.

17-jointed : Last joint of  
palpi

much the longest  
nearly equal

7. ULA.

11. CYLINDROTOMA.

three (with an  
additional  
branch subse-  
quent : Discal  
areolet .

none

5<sup>f</sup>. LIMNOBIA.  
(*Amalopis, Hal.*)

one: An-  
tennae

of more than 13 joints

14. NEPHROTOMA.

13-jointed

unbranched  
in either sex

15. TIPULA.

pectinated  
in the male

16. CTENOPHORA.

obsolete; a fold in place of it

17. PTYCHOPTERA.

Not British, as far as known.

## GENERAL INDEX.

---

The following General Index to the three volumes of DIPTERA, the first, second, and fourth of 'Insecta Britannica,' contains the Generic names and Synonyms of the text, along with most of those in Stephens' Systematic Catalogue, Curtis's Guide, and the generic synopsis in Westwood's Introduction. Synonyms and Subgenera are in *Italics*, but in some extensive groups of the text, as *Anthomyia*, it has not been attempted so to reduce the groups, many of which must be ultimately admitted. The large Roman numerals indicate the volume, the small ones the pages of the Introduction to the fourth volume, the Arabic numerals the pages of the rest; but, when preceded by sp., the number of some species, in the last-quoted page, which exemplifies the subgenus or group. It has not been thought necessary to notice slight differences of orthography in the names, unless where the name might in consequence be out of sight in the place looked for.

## DIPTERA.

### SUCTORIDEA.

#### FAMILY I. PULICIDÆ.

The characters of *Suctoridae*, in Vol. I. p. 4 of this work, will also serve for the *Pulicidæ*, which is the only Family in that division.

##### Genus I. **PULEX.**

**PULEX**, L. S. N. ii. 1021 (1753); Latr. ; Lea. ; Dugès ; Bouché ; Newm.  
*Pulex et Ceratophyllum aut Ceratopsyllus*, Curt. *Pulex et Ischnopsyllus*, Westw.

Corpus compressum, coriaceum, nitens, setosum. Oculi parvi, rotundi, simplices. Mandibulae setiformes, compressæ, marginibus serrulatis. Lingua nulla. Maxillæ parvæ, lamelliformes, coriaceæ, subtriangularis. Palpi maxillares 4-articulati. Labium parvum, membranaceum. Mentum minutum. Palpi labiales triarticulati. Antennæ 4-articulatæ; articulus quartus incisuris transversis. Abdomen segmentis septem. Pedes longi; postici saltatori; coxae magnæ; femora robusta; tibiæ setosæ; unguis validi.

Body compressed, hard, shining, setose. Eyes small, round, simple. Mandibles composed of two elongated, flattened setæ, with a central rib, and with the edges finely serrulated. Lingua obsolete. Maxillæ small, lamelliform, coriaceous, subtriangular. Maxillary palpi four-jointed, attached to the base of the maxillæ. Labium small, membranous. Mentum smaller than the labium. Labial palpi three-jointed, seated on the apex of the labium. Antennæ four-jointed; third joint very minute; fourth with transverse incisions, and apparently articulated. Prothorax, mesothorax, and metathorax short. Abdomen com-

posed of seven distinct segments. Legs long, the hind pair formed for leaping; coxae large; femora stout; tibiæ setose; tarsi with two strong claws.

Very few insects are more generally known than the Flea; and for a more detailed history of it, the following authors may be especially consulted:—Leuwenhoeck, Rösel, De Geer, Latreille, Defrance, Dugès, Bouché, Strauss-Durckheim, Newman, and Westwood. The South American Chigoe or Jigger, *Pulex penetrans*, L. (genus *Sarcopsylla*, Westw.), is much more injurious, for it buries itself beneath the skin, and sometimes causes mortification. The eggs of the common flea are large, white, oval. The larvæ are long and vermiform, with thirteen segments; the head is rather longer than the other segments, and somewhat attenuated in front, and has two short one-jointed antennæ; the anal segment is furnished with two slightly curved appendages. They feed on animal matter, whether on the bodies of birds and beasts, or cast off. The pupa is inactive, and generally enclosed in a silken cocoon. The following specific descriptions are mostly translated from Bouché.

1. **irritans**, L. S. N. ii. 1021 (1753); F.; Gmel.; Scop.; Leach; Dugès; Bouché; Guér. *Piceo-fusca, capite nitente lœvi sparse et subtiliter punctato, pedibus pallidioribus, femoribus posticis intus ciliatis, tarsorum anticorum articulo secundo posticorum primo longissimo.* Long. 1 lin.

**THE COMMON FLEA.**—*Abdomen above with two stout apical diverging bristles. Coxæ very broad, flat, with short bristles above. Femora equally broad, flat, somewhat thicker than the coxae, with short hairs, fore pair with two stout apical bristles above, hind pair fringed with bristles on the inner side. Tibiæ and tarsi with stout apical spines. Ungues fringed beneath with little spines. The joints of the tarsi in relation to their comparative length have the following succession in the fore pair, 2, 5, 1, 3, 4, and in the hind pair, 1, 5, 2, 3, 4.*

Generally distributed. (E. S. I.)

2. **Canis**, St.; Dugès A. S. N. 163. 2. pl. 4. f. 2–5 (1832); Bouché; Steph.; Curt.—*terrestris?* Macq. *Pallide piceo-fusca, capite nudo nitente lœvi sparse et subtiliter punctato, coxis et femoribus fere nudis, tarsorum anticorum articulo quinto posticorum primo longissimo.* Long.  $\frac{4}{5}$  lin.

*Resembles P. irritans, but is smaller and paler, and has shorter legs; coxae slightly bristly. Femora almost bare. Tibiæ thicker than in P. irritans. Joints of the fore tarsi in relation to their comparative length, 5, 2, 1, 3, 4; of the hind tarsi, 1, 5, 2, 3, 4. Ungues of the male broad, and fringed with black spines on both sides.*

Infests the dog and the fox. (E. S. I.)

3. **Gallinæ**, Schr. F. B. iii. 195 (1798); Bouché. *Piceo-fusca,*

*ovata, capite nitente lœvi longiusculo, prothorace nigro-costato, tarsorum omnium articulo primo longissimo. Long.  $\frac{2}{3}$  lin.*

*Much smaller and more compact than P. irritans. Antennæ almost lanceolate; last joint slender. Maxillary palpi slender, filiform. Legs much contracted, with bare femora, and with slightly spinose tibiæ and tarsi. Joints of all the tarsi in relation to their comparative length, 1, 2, 5, 3, 4.*

The larvæ resemble those of *P. irritans*, but are darker. The eggs are white, globose, and continue about fourteen days.

On hens, especially in their nests. (E. S. I.)

4. **Felis**, Bouché, Nov. Act. Acad. Cæs. xvii. 1. 505. 4 (1835).  
*Pallide piceo-fusca, capite nitente lœvi postice punctato, facie subtus genique ciliis nigro-spinulosis, prothorace nigro-costato, tibiis posticis apice dilatatis, tarsorum anticorum articulo quinto posticorum primo longissimo. Long.  $\frac{4}{5}$  lin.*

*Almost as large as P. irritans. The whole of the face beneath and the genæ fringed with little black spines, which, in the last, have a lateral direction. Fore coxæ altogether coarsely punctured. Femora bare, hind pair fringed on the inner side with long bristles. Tibiæ and tarsi spinose. Joints of the fore tarsi in relation to their comparative length, 5, 2, 1, 3, 4; of the hind tarsi, 1, 2, 5, 3, 4.*

Infests the cat. (E. S. I.)

5. **Martis**, Bouché, Nov. Act. Acad. Cæs. xviii. 1. 506. 5 (1835).  
*Piceo-fusca, capite lœvi nitente nudo, genis spinulis nigris ciliatis, prothorace nigro-costato, tibiis apice dilatatis, tarsorum anticorum articulo quinto posticorum primo longissimo. Long.  $\frac{4}{5}$  lin.*

*Darker than P. Felis, which it much resembles, and the joints of the tarsi have the same comparative length; the clypeus is without spines, and the body is not so thickly covered with bristles as in that species. Fore coxæ coarsely punctured; femora bare, the hind pair fringed with bristles; tibiæ and tarsi with stout spines.*

Infests martens and dogs. (E.)

6. **Sciurorum**, Olf. Comm. 48 (1816); Schr.; Bouché. *Pallide piceo-fusca, nitens, lœvis, capite nudo, prothorace nigro-costato, abdominis lateribus nudis, tarsorum articulo primo longissimo. Long.  $1\frac{1}{6}$  lin.*

*Somewhat larger and more elongated than P. irritans. Body smooth, shining. Head bare. Antennæ pale yellow, short, obconical. Prothorax ribbed. Mesothorax almost bare. Femora bare, contracted. Fore tarsi without spines. Hind tarsi shorter than in the other species. Joints of the fore tarsi in relation to their comparative length, 1, 5, 3, 3, 4; of the hind tarsi, 1, 2, 3, 5, 4. Ungues straight, and so close together as to be apparently but one; the middle pair somewhat thickened.*

Infests the squirrel. (E. S. I.)

7. **Erinacei**, Leach; Bouché, Nov. Act. Acad. Cæs. xvii. 1. 507. 7 (1835). *Pallide piceo-fusca, capite nitente lœvi, antice nudo, postice*

*punctato et setoso, metathorace nigro-costato supra sulcis latioribus, tarsorum anticorum articulo quinto posticorum primo longissimo. Long. 1 lin.*

*As large as P. irritans. Each eye beneath with two downward-pointing bristles. Hind border of the mesothorax fringed with little spines, which appear like black ribs on the metathorax. Fore coxae large, coarsely punctured, and, like the others, beset with a few bristles. Femora bare. Tibiae and tarsi, the hinder especially, bristly. Joints of the fore tarsi in relation to their length, 5, 2, 1, 3, 4; of the hind tarsi, 1, 2, 5, 3, 4.*

Infests the hedgehog. (E. S. I.)

8. **Talpæ** (Sam. Comp. 1. 35) Curt.! B. E. pl. 114 (1826); Bouché.—*fasciatus*, Latr.; Rose. *Fusco-flava, capite nitente setoso, antennis fusiformibus, prothorace costato nigro, coxis anticis spinosis, tarsorum omnium articulo primo longissimo. Long.  $\frac{3}{4}$ —1 lin.*

*Legs dark. Joints of the fore tarsi in reference to their length, 1, 5, 2, 3, 4; of the hind tarsi, 1, 2, 5, 3, 4. Hind metatarsi very long and thick. Fem. Apical abdominal segment extended on each side, and so forming two vertical semicircular discs.*

Infests the mole. (E. S. I.)

9. **Musculi**, Dugès, A. S. N. xxvii. 163. 3. pl. 4. f. 3. 10 (1832); Bouché.—*Muris*, Curt.

*Fusco-flava, antice attenuata, capite punctato setoso, temporibus spinulis nonnullis abbreviatis ciliatis, prothorace costato; femoribus arcuatis, tarsorum anticorum articulo quinto, posticorum primo longissimo. Long.  $\frac{4}{5}$  lin.*

*Body much attenuated in front. Head wholly clothed with short bristles; temples with some short, small black spines. Legs almost without spines; femora and fore tibiae curved; the latter fringed with black bristles; fore coxae coarsely punctured with black bristles. Joints of the fore tarsi with reference to their length, 5, 2, 1, 3, 4; of the hind tarsi, 1, 2, 3, 5, 4. Fore unguis incrassated.*

Infests the common mouse. (E. S. I.)

10. **Vespertilionis**, Sam.; Dugès, A. S. N. xxvii. 164. 4. pl. 4. f. 4 (1832); Bouché; Steph.; Curt.—*elongatus*, Curt.! B. E. pl. 417.—*trifasciatus*, Curt. *Fusco-flava, antice valde attenuata, capite longo setis postice incumbentibus, prothorace abdominisque segmentis primo secundo quinto sexto et septimo nigro-costatis, pedibus gracilibus, tarsorum omnium articulo primo longissimo. Long.  $\frac{3}{4}$  lin.*

*Body much attenuated in front. Head long, pointed. Antennæ fusiform. Genæ with two black conical little spines on each side. Legs long, slender, pale yellow, with black articulations. Joints of all the tarsi with reference to their length, 1, 2, 3, 5, 4.*

Infests the bat. (E. S. I.)

11. **Fringillæ**, Steph. MSS. *Parva, brevis, lata, testacea, nitens, supra nigricans, P. Hirundinis minor et brevior, pedibus gracilioribus minusque setosis. Long. 1 lin.*

*Body small, rather short and deep, testaceous, shining blackish above; smaller and shorter than P. Hirundinis, and with more slender and less bristly legs.*

Infests the nests of the sparrow. (E. S. I.)

12. **Hirundinis**, Steph.; Sam. Ent. Comp. I. 35; Curt. *Testacea, subelongata, antennis abbreviatis, thoracis fascia postica nigra, abdominalis apice subsetoso, pedibus setosis.* Long.  $1\frac{1}{4}$  lin.

*Testaceous, slightly elongated. Antennæ short. Thorax with a black band on the hinder part. Abdomen slightly setose at the tip. Legs setose; joints of the tarsi from the first to the fourth successively decreasing in length; fifth longer than the third.*

Infests the swallow. (E. S. I.)

13. **Columbae**, Steph. Syst. Cat. ii. 328. 9315. 10; Curt. *Testacea, valde elongata, antice attenuata, fasciis 5 aut 6 nigris, abdominalis apice pedibusque subsetosis.* Long.  $1\frac{1}{4}$  lin.

*Body testaceous, much elongated, attenuated in front, with five or six slight black bands. Antennæ of moderate length. Tip of the abdomen and legs slightly setose; joints of the hind tarsi from the first to the fourth successively decreasing in length.*

Infests the pigeon. (E. S. I.)

14. **Melis**, Leach, MSS. *Magna, testacea, sat longa, subpilosa, antennis sat longis, abdominalis apice quadrisetoso, pedibus setosulis.* Long.  $1\frac{1}{2}$  lin.

*Large, testaceous, rather long, slightly hairy. Antennæ filiform, longer than the head; second joint longer than the first; third shorter than the second; fourth longer than the third. Abdomen with four bristles near the tip. Legs rather setose; joints of the tarsi from the first to the fourth successively decreasing in length.*

Infests the badger. (E.)

## NEMOCERA.

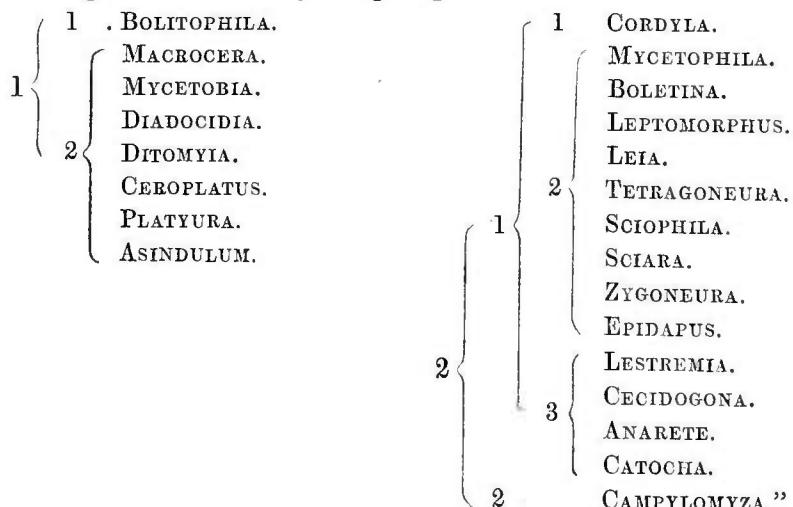

NEMOCERA, Latr.; Meq.; Westw.; Zett.; Ross. (V.). *Tipulariæ, Meig.; Lam.; Fall.; Rafinesque. Sclerostoma p., Dumr. Tipulidæ, Rond. Tipulidii, Bigot. Aplocera p., Dumr. Tipulina et Culicina, Newm. Polymera, Burm. Culicina et Tipulariæ, Agas.*

This is the first group of the *Proboscidea*, which follow the *Suctoridae*; its characters are detailed in Vol. I. p. 5 of this work. It comprises ten families.

ther from the angle of the brachial areolet, but in the others form a petiolated fork, the anterior branch being very short, and nearly transverse, in *Platyura*, *Asindulum*, and *Ceronplatus*.

"In the second group most of the genera have the petiolate forked vein, which represents the subapical vein, and a second forked vein, the pobrachial with the subanal (the latter wanting in *Mycetophila nitida* and its affinities). *Sciophila* and *Tetragoneura* have a small arcolet, closed by a transverse vein (wanting in the rest), which, though changed in position, appears analogous to the anterior branch of the cubital in *Platyura*, etc. *Lestremia* and the allied genera differ from *Sciara* chiefly by the origin of the subapical vein; the spurless tibiæ, shorter coxæ, and vacillating number of the joints of the antennæ, and evidently four-jointed palpi, approaching, as I think, to *Campylomyza*, in which the short coxæ of the fore pair do not touch the second pair, the subapical vein is simple, and the subanal springs from the pobrachial, very near the end, forming a short fork. *Catocha* is allied to *Lestremia*, but the difference of the veins is evident. With respect to *Epidapus*, the disappearance of the ocelli, with the wings and halteres, leaves fewer marks by which to collocate it, but the form of the abdomen, with the sixteen-jointed antennæ, place it near *Sciara*; the spurless tibiæ show an approach to *Lestremia*.

"The genera then may be grouped thus:—

*Haliday, MSS.*

## Genus I. **MYCETOPHILA.**

MYCETOPHILA, Stæger, Dipt. Dan. (1840); Zett. D. S. *Sciara* p.,

Fabr. *Mycetophila* p., Meig.; Mcq.; Curt.; Westw. *Mycetophila* p. et *Macquartia*, Zett. I. L.

Corpus saepissime parvum, elongatum, pubescent, pallidum, fuscum, aut nigricans. Caput parvum, rotundatum, subtransversum, sessile, thorace humilius. Frons lata. Oculi ovati. Ocelli tres, quorum duo laterales remoti, *medius minimus*. Proboscis brevis. Palpi 4-artieuli, ineuri, subfiliformes; artieulus primus minutus; secundus, tertius, et quartus subaequales. Antennae 16-artieulatae, filiformes aut subcylindricae, subcompressae, areuatim porrectae, corporis dimidio non longiores. Thorax ovatus, convexus. Metathorax deelivis. Alae medioeres, incombentes; venae subapicalis et subanalis saepissime fureatae. Abdomen segmentis 7, plus minusve compressum. Pedes medioeres; eoxae magnae; femora compressa; tibiae spinosae, apice calearatae; tarsi longi, graciles. Mas. Abdomen subcylindricum, apice obtusum. Fem. Abdomen plus eompressum, apice acutum.

Body more or less small, elongated, pubescent, testaceous, yellowish, brown, or black. Head small, sessile, rounded, slightly transverse, lower than the thorax. Front broad. Eyes oval. *Ocelli 3, the middle one very minute*, the lateral pair remote. Proboscis short. Palpi four-jointed, curved downward, nearly filiform, having a considerable difference in some species; first joint minute, the rest nearly equal in size. Antennae sixteen-jointed, filiform or nearly cylindric, slightly compressed, setaceous or conical, and thick in some species, curved and porrect, not more than half the length of the body. Thorax oval, convex. Metathorax sloping. Wings of moderate length and breadth, incombent, hyaline, occasionally spotted; radial vein straight, ending at before three-fourths of the length; cubital emitting the subapical at a little beyond the middle of the wing, near which it forms an angle at its junction with the praebraehial transverse, and is thence straight to the end, which is a little in front of the tip of the wing; the praebraehial transverse vein, and the radial before its junction therewith, close the praebraehial areolet, and are termed its veinlets in the following specific descriptions; subapical forked, fore fork ending at very little behind the tip of the wing; subanal generally forked, ending at about three-fourths of the length; anal varying as to length; humeral veinlet near the base; areolets generally 10—the humeral, the radial, the subcostal, the praebraehial, the pobraehial, the cubital, the subapical, one externo-medial, the anal, and the axillary; posterior margin forming a very obtuse angle at full twice the length of the humeral areolet from the base. Halteres distinct, rather short. Abdomen with seven segments, *more or less compressed*. Legs of moderate length; eoxae long; femora compressed; four hinder tibiae spinose, with two spurs at the tips; fore tibiae hardly spinose, with one spur at the tips; tarsi long, slender. Male. Abdomen nearly cylindric; tip obtuse. Fem. Abdomen more compressed; tip acute.

The species of all the *Mycetophilidae* are most distinguished by

*Note.* The specimen here described has much resemblance to *M. nigra*, and may possibly not be *M. paludosa*.  
Rare. (E.)

5. **pictipennis**, Stæg. D. D. 266. 41 (1840); Zett. Nigra, subnitens, *alis subcinereis maculis duabus diffusis fuscis apud marginem posticum connexis et pallidioribus, halteribus pedibusque testaceis, tarsis nigricantibus*. Long. 1; alar. 2 lin.

Black, slightly shining. Palpi and antennæ blackish. Thorax with tawny down. *Wings greyish, with a large brown spot by the præbrachial areolet, and another near the tip of the costa; these spots are connected in the disc of the wing, and extend thence in a paler band to the hind border; veinlets of the præbrachial areolet forming an obtuse angle; the hind one about twice the length of the fore one, and as long as the subapical vein before its fork; anal vein short. Halteres testaceous. Legs dingy, testaceous; tarsi blackish.*

Rare. (E.)

6. **rara**, Stæg. D. D. 266. 42 (1840); Zett. Nigro-fusca, palpis pedibusque fulvis, antennis fuscis basi fulvis, thorace maculis duabus fulvis, *alis subcinereis, maculis duabus subobsoletis fuscescensibus, halteribus albidis, tarsis fuscis*. Long.  $1\frac{1}{4}$ - $1\frac{1}{2}$ ; alar.  $2\frac{1}{2}$ -3 lin.

Blackish-brown. Palpi tawny. Antennæ brown, not longer than the thorax, tawny at the base. Thorax slightly clothed with pale tomentum; a tawny spot on each side in front. *Wings very slightly greyish, with a large, indistinct, brownish, subapical, costal spot; transverse veinlets of the præbrachial areolet very slightly clouded with brown, forming a very obtuse angle; the hind one about twice the length of the fore one, and nearly as long as the subapical vein before its fork; anal vein about half the length of the subanal. Halteres whitish. Legs tawny; tarsi brown; fore tibiæ hardly longer than the fore metatarsi.*

Rare. (E.)

7. **bimaculata**, F. S. A. 59. 12 (1805); Stæg.; Zett. D. S.—*bimaculata*, Meig.—*arcuata* p., Zett. I. L.—*pictula*? Meig. Nigro-fusca, palpis, thoracis vittis duabus, halteribus, ventre, segmentorum marginibus posticis pedibusque testaceis, antennis basi fulvis, *alis subcinereis macula discali fasciaque subapicali obscuris, apicibus cinereis, tarsis fuscis*. Long.  $2-2\frac{1}{2}$ ; alar. 4-5 lin.

Blackish-brown, thinly clothed with pale down. Palpi testaceous. Antennæ blackish-brown, tawny at the base. Thorax very stout, on each side with a testaceous stripe, which is dilated in front. *Wings slightly greyish, with a brown spot, which extends from the costa to the præbrachial areolet, and at three-fourths of the length with a grey band, which is brown in front; tips grey; veinlets of the præbrachial areolet forming a very obtuse angle; the hind one about twice the length of the fore one, and of the subapical vein before its fork; subanal vein forked*

at a little beyond the fork of the subapical; anal vein extending far beyond the fork of the subanal. Halteres testaceous. Abdomen testaceous beneath and along the hind borders of the segments. Legs testaceous; tarsi brown; fore tibiæ as long as the fore metatarsi.

Not common. (E. I.)

In the two following species, the veinlets of the præbrachial areolet form a slightly obtuse angle; the hind one is more than twice the length of the fore one, and of the subapical vein before its fork. Subanal vein forked at very little before the fork of the subapical. Anal vein not extending beyond the fork of the subanal.

8. ***lutescens***, Zett. D. Sc. xi. 4178. 3 (1852). *Fulva*, antennis fuscescentibus basi fulvis, peetore halteribus pedibusque testaceis, alis subcinereis ad costam fulvescentibus macula discali fasciaque subapicali fuscis, abdomine fuseo apice fulvo, segmentorum marginibus posticis albidis, tibiis tarsisque ferrugineis. Long. 2-2½; alar. 4-5 lin.

Tawny. Antennæ brownish, tawny at the base. Peetus testaceous. Wings slightly greyish, somewhat tawny in front, with a brown undulating subapical band, which does not extend to the hind border, and with a brown spot on the tip of the præbrachial areolet and of the fork of the subapical vein. Halteres testaceous. Abdomen brown; hind borders of the segments whitish; tips tawny. Legs ferruginous; coxæ and femora testaceous; fore tibiæ hardly longer than the fore metatarsi.

Not common. (E.)

9. ***cingulum?*** Mcig. Zw. vi. 299. 34 (1830); Stann. *Testacea*, antennis fulvis, alis subfulvescentibus macula discali fasciaque subapicali fuscis, abdomine fulvo fasciis testaceis, femoribus posterioribus tarsisque apice fuscis. Long. 2½; alar. 5 lin.

*Testaceous*. Antennæ tawny, testaceous at the base. Wings with a slight tawny tinge, which is most apparent in front, with a brown spot on the tip of the præbrachial areolet, and of the fork of the subapical vein, and at three-fourths of the length with a brown oblique band, which is interrupted between the subapical and subanal veins, and does not extend to the border. Abdomen tawny above, with the exception of the hind borders of the segments. Tarsi brownish towards the tips; posterior femora with brown tips; fore tibiæ much longer than the fore metatarsi.

Not common. (E. I.)

10. ***lunata***, F. S. A. 58. 6 (1805); Meig.; Mcq.; Zett.; Stæg.; R.—*arcuata*, Meig.—*signata*, Meig.; Stann.—*distigma*, Meig. *Fulva*, antennis nigricantibus basi fulvis, thoracis diseo nigricante bivittato, alis subcinereis fusco bimaculatis, abdomine nigro marginibus posticis apice que fulvis, pedibus testaceis, femoribus postieis apice tarsisque fuscis. Long. 1½-2; alar. 3-4 lin.

Tawny. Antennæ blackish, tawny towards the base. Disc of the

the subanal vein. Halteres testaceous. Legs tawny, brownish; fore tibiæ longer than the fore metatarsi.

Not rare. (E.)

16. **selecta**, n. *Nigra*, antennis basi palpisque testaceis, halteribus albis, alis fuseescentibus, venis optime determinatis, pedibus fulvis. Long. 2; alar.  $3\frac{1}{2}$  lin.

*Black*. Palpi testaceous. Antennæ testaceous at the base. Halteres whitish. Wings brownish; veins strongly marked; veinlets of the præbraehial areolet forming a slightly obtuse angle, the hind one about twice the length of the fore one, and longer than the subapical vein before its fork; fork of the subanal vein much nearer than the fork of the subapical to the base of the wing; anal vein extending nearly to the border. Legs tawny, stout, not long; spurs very long; hind femora thickly armed with long spines; *fore tibiæ hardly longer than the fore metatarsi*.

Rare. In the British Museum. (E.)

17. **striata**, F. S. A. 58. 5 (1805).—*punctata*, Meig.; Stann.; Meq.; Stæg.; Rs.; Zett. D. S.—*semicincta*, Meig.—*cunctans*, Wied.; Meig.; Meq.; Zett. I. L.—*trivialis*? Meig.; Wieg.—*rufa*? Meq.; Meig. *Fulva*, thoraeis diseo maeulis tribus ferrugineis, peetore halteribusque testaceis, alis subfulvescentibus, abdominis segmentis ferrugineo-faseiatis, tarsis fuseescentibus. Long. 2- $2\frac{1}{2}$ ; alar. 4-5 lin.

Tawny. Disease of the thorax with three large ferruginous spots, the middle one in advance. Peetus testaceous. Wings with a tawny tinge; veinlets of the præbraehial areolet forming a right angle, the fore one about half the length of the hind one, and nearly as long as the subapical vein before its fork; fork of the subanal vein a little nearer than the fork of the subapical to the base of the wing; anal vein not extending to the fork of the subanal. Halteres testaceous. Abdomen with ferruginous bands. Tarsi brownish; *fore tibiæ longer than the fore metatarsi*.

Common. (E. S. I.)

18. **unicolor**, Meig. Zw. vii. 43. 51 (1838). Ferruginea, antennis pedibusque cœnoloribus, alis pallide fulvis, tarsis fusca. Long. 2; alar. 4 lin.

Ferruginous, as are also the antennæ and the legs. Wings pale tawny. Tarsi brown.

"In this species particularly, the palpi are shorter and stouter, the exterior joints not linear nor increasing in length, but obovate or spatulate."—*Haliday, MSS.*

Not rare. Has been found at Holywood, near Belfast, and at Blarney, Cork. In Mr. Haliday's collection. (I.) This species is unknown to me, and I am not certain whether it belongs to the preceding group.

The twenty-three following species form a group which is dis-

tinguished from the preceding by the less robust body and legs, and comparatively few short and slender spines of the hind tibiæ.

19. **maculosa**, Meig. Zw. i. 268. 18 (1818); Zett.; Stæg.; Rs. *Testacea*, vertiee, antennis, *thoracis vittis tribus abdomineque ferrugineis*, hujus segmentis testaceo-faseiatis, pedibus grælibus, tarsis fuseis. Long. 2-3; alar. 4-5½ lin.

*Testaceous.* Vertex ferruginous. Antennæ ferruginous, testaceous at the base. *Thorax with three ferruginous stripes*, the middle one in advance, and divided longitudinally. Wings with a very slight tawny tinge; veinlets of the præbrachial areolet forming a slightly acute angle, the fore one much less than half the length of the hind one, and about half the length of the subapical vein before its fork; anal vein extending much beyond the fork of the subanal. Abdomen ferruginous; hind borders of the segments testaceous. Legs long, slender; spurs long; tarsi brown; hind tibiæ with very short spines; *fore tibiæ shorter than the fore metatarsi*.

Not rare. (E.)

20. **sericea**, Meq. D. N. F. 95. 14 (1826).—*sericoma*, Meig. *Nigrans*, albido-tomentosa, palpis halteribus pedibusque testaceis, antennis basi *thoracisque maculis duabus anticis fulvis*, alis sublimpidis, pedibus longiuseulis, tarsis fusecentibus. Long. 1-1½; alar. 2-3 lin.

*Blackish.* Head and thorax with white tomentum. Palpi testaceous. Antennæ rather longer than the thorax, tawny towards the base. *Thorax with a tawny spot on each side in front.* Wings nearly limpid; veinlets of the præbraehial areolet forming a very slightly acute angle, the hind one full three the length of the fore one, and as long as the subapical vein before its fork; anal vein extending some little distance beyond the fork of the subanal. Halteres testaceous. Abdomen with a testaceous spot on each side before the middle. Legs testaceous, rather long; tarsi brownish; spurs long; hind tibiæ with very few spines; *fore tibiæ longer than the fore metatarsi*.

Common. (E. S. I.)

21. **fasciata**, Meig. Zw. i. 267. 16 (1815).—*discoidea*, Zett. D. S.—*maculosa* p., Zett. I. L. *Ferruginea*, subtus testacea, palpis, halteribus, abdominis fasciis apieque testaceis, pedibus longis obseure testaceis, tarsis nigrieantibus. Long. 1¾-2¼; alar. 3-4 lin.

*Ferruginous*, testaceous beneath. Palpi testaceous. Antennæ brownish, testaceous at the base. Wings slightly greyish; præbraehial areolet closed by two veinlets, which form a right angle, the hind one full six times the length of the fore one, and about three the length of the subapical vein before its fork, its hind branch curved; anal vein extending far beyond the fork of the subanal. Halteres testaceous. Abdomen with four testaceous bands on the fore borders of the segments; tip testaceous. Legs long, slender, darker testaceous; spurs long; tarsi blackish; hind tibiæ with a few minute spurs; *fore tibiæ much shorter than the fore metatarsi*.

*front.* Wings greyish; veinlets of the præbrachial areolet forming a nearly right angle; the hind one about thrice the length of the fore one, and as long as, or a little longer than the subapical vein before its fork; anal vein not extending so far as the fork of the subanal. Halteres testaceous. Hind borders of the abdominal segments testaceous. Legs testaceous; femora with a brown spot on each end; tibiæ darker than the femora; spurs long; tarsi brownish; hind tibiæ with short spines; *fore tibiæ as long as the fore metatarsi.*

Not common. (E.) This species much resembles *M. flavipes*, but may be distinguished by its shorter hind tibiæ.

28. **conformis**, n. *Nigro-cinerea*, palpis halteribus *abdominis maculis lateralibus* pedibusque *testaceis*, alis limpidis, femoribus tibiisque apiee tarsisque nigris. Long.  $1\frac{1}{2}$ ; alar. 2 lin.

Male blackish-grey. Palpi testaceous. Antennæ stout, very much longer than the thorax. Wings limpid; veinlets of the præbrachial areolet forming an obtuse angle, the hind one about twice the length of the fore one, and nearly as long as the subapical vein before its fork. Halteres pale testaceous. *Abdomen with testaceous spots on each side, except at the tip.* Legs testaceous; tarsi and tips of the femora and of the tibiæ black, stout; hind tibiæ with rather short spurs and very minute spines; *fore tibiæ longer than the fore metatarsi.*

Rare. (E.)

29. **crassicornis**, Stann. Observ. Spee. Myetoph. 22. 20 (1831); *punctipes*, Stæg.; Zett.—*spinicoxa*, Zett. *Nigricans*, albido-tomentosa, capite fulvo, palpis, antennis basi, *thoracis vittis duabus*, halteribus, *ventre pedibusque testaceis*, alis subeinereis, tibiis tarsisque fuseis. Long.  $2-2\frac{1}{2}$ ; alar.  $3\frac{1}{2}-4\frac{1}{2}$  lin.

*Blackish.* Head and thorax slightly covered with whitish tomentum. Head tawny. Palpi testaceous. Antennæ testaceous at the base. *Thorax on each side with a testaceous stripe*, which is broadest in front. Wings slightly greyish; veinlets of the præbrachial areolet forming a slightly acute angle, the hind one about twice the length of the fore one, and longer than the subapical vein before its fork; anal vein not quite extending to the fork of the subanal. Halteres testaceous. *Abdomen testaceous beneath for two-thirds of the length from the base; tip and hind borders of the segments also testaceous.* Legs testaceous, rather long; tibiæ and tarsi brown; spurs long; hind tibiæ with moderately long spines; *fore tibiæ much shorter than the fore metatarsi.* *Male.* Antennæ rather stout, a little longer than the thorax. *Fem.* Antennæ stout, lanceolate, a little shorter than the thorax.

Not rare. (E. I.)

30. **fuscula?** Zett. I. L. 864. 8 (1840). *Nigro-fusca*, palpis, antennis basi, halteribus pedibusque testaceis, alis subeinereis, tarsis fusceis. Long.  $1-1\frac{1}{4}$ ; alar.  $1\frac{1}{2}-2$  lin.

*Blackish-brown.* Palpi testaceous. Antennæ not longer than the thorax, testaceous at the base. Wings slightly greyish; veinlets of the

præbrachial areolet forming a hardly obtuse angle, the hind one nearly four times the length of the fore one, and as long as the subapieal vein before its fork; anal vein extending to the fork of the subanal. Halteres testaceous. Legs testaceous; tarsi brown; hind tibiae armed with short spines and with very long spurs; *fore tibiæ a little longer than the fore metatarsi.*

Not common. (E.)

31. **terminalis**, n. *Nigra*, pallido-tomentosa, palpis antennis basi pedibusque testaceis, alis subcinereis, halteribus albidis, tarsis fusecentibus, femoribus posterioribus basi apiceque nigricantibus, tarsis fuscentibus. Long.  $1\frac{1}{4}$ ; alar.  $2\frac{1}{2}$  lin.

*Black*, clothed with pale tomentum. Palpi testaceous. Antennæ not larger than the thorax, testaceous at the base. Wings slightly greyish; veinlets of the præbrachial areolet forming an obtuse angle, the hind one nearly twice the length of the fore one, and a little shorter than the subapieal vein before its fork; anal vein not extending to the fork of the subanal. Halteres whitish. Legs testaceous; tarsi brownish; posterior femora blackish at the base and at the tips; hind tibiæ armed with short slender spines and with long spurs; *fore tibiæ fully as long as the fore metatarsi.*

Rare. (E.)

32. **finalis**, n. *Nigro-cinerea*, palpis, antennis basi, halteribus, *abdominis maculis trigonis lateralibus* pedibusque testaceis, antennis nigris robustis thorace longioribus, alis sublimpidis, pedibus validis, femoribus tibiisque apice tarsisque nigris. Long.  $1\frac{1}{4}$ ; alar. 2 lin.

*Greyish-black*. Palpi testaceous. Antennæ black, stout, testaceous at the base, longer than the thorax. Wings nearly limpid; veinlets of the præbrachial areolet forming a very obtuse angle; the hind one much longer than the fore one, and about one-third of the length of the subapieal vein before its fork; anal vein not extending to the fork of the subanal. Halteres pale testaceous. *Abdomen with lateral triangular testaceous spots*. Legs stout, testaceous; tarsi and tips of the femora and of the tibiæ black; hind tibiæ with very minute spines and rather long spurs; *fore tibiæ nearly twice the length of the fore metatarsi.*

Rare. (E.) This species may be said to connect *Leia* with *Mycetophila*.

33. **longicornis**, n. *Mas*, einerea, vertice thoraeisque lateribus albidis, antennis thorace duplo longioribus, alis subcinereis, *abdominis maculis quatuor lateralibus* apiceque testaceis, pedibus testaceis, tarsis nigricantibus. Long.  $1\frac{3}{4}$ ; alar.  $2\frac{1}{2}$  lin.

*Male*. Cinereous. Vertex and sides of the thorax whitish. Palpi testaceous. Antennæ blackish, testaceous at the base, about twice the length of the thorax. Wings very slightly greyish; veinlets of the præbrachial areolet forming a slightly obtuse angle, the hind one nearly four times the length of the fore one, and nearly twice the length of

ments; tibiæ darker than the femora; tarsi and tips of the hind femora brown; hind tibiæ with rather long spurs and very minute spines; *fore tibiæ much shorter than the fore metatarsi.*

Not common. (E.)

40. **tarsata?** Stæg. D. D. 264. 37 (1840); Zett. *Nigra*, palpis, antennis basi, *thoracis lateribus anticis, pectore*, halteribus pedibusque *testaceis*, alis eimerascentibus antice subtestaceis, pedibus validiusculis, femoribus tibiisque apice tarsisque fuscis. Long. 1; alar. 2 lin.

*Black.* Palpi testaceous. Antennæ testaceous at the base. *Thorax on each side in front and pectus testaceous.* Wings a little greyish, with a slight testaceous tinge in front; veinlets of the præbrachial areolet forming a slightly obtuse angle, the hind one full twice the length of the fore one, and nearly as long as the subapical vein before its fork; anal vein extending indistinctly to the fork of the subanal. Halteres testaceous. Legs testaceous, rather stout; tarsi and tips of the femora and of the tibiæ brown; hind tibiæ with long spurs and minute spines; *fore tibiæ a little shorter than the fore metatarsi.*

Rare. (E.)

41. **leioides**, n. *Pallide lutea*, antennis nigris, alis subcinereis, *abdominis fasciis basi apiceque nigris*, tarsis fuseis. Long.  $1\frac{3}{4}$ ; alar.  $3\frac{1}{2}$  lin.

*Pale luteous*, slightly pubescent. Palpi testaceous. Antennæ black, testaceous towards the base, not longer than the thorax. Wings slightly greyish; veinlets of the præbrachial areolet forming a hardly obtuse angle, the hind one full twice the length of the fore one, and as long as the subapical vein before its fork; anal vein extending to the fork of the subanal. Halteres whitish. *Abdomen with black bands above, wholly black at the base and towards the tip.* Legs rather stout; tarsi brown except towards the base; hind tibiæ with minute spines and rather long spurs; *fore tibiæ not shorter than the fore metatarsi.*

Rare. (E.)

The following additional species of this genus have been recorded as British:—

1. *luetuosa*, Meig. Zw. vi. 299. 35 (1830).
  2. *pusilla*, Meig. Zw. vi. 300. 38 (1830).
  3. *lugens*, Wied., Meig. Zw. i. 269. 20 (1818).
  4. *analis*, Meig., Meig. Zw. i. 269. 21 (1818).
  5. *flaviceps*, Meig. Zw. i. 270. 22 (1818).
  6. *pallida*, Stann. Observ. Spec. Mycetoph. (1831).
  7. *intersecta*, Hoff., Meig. Zw. i. 271. 25 (1818).
  8. *flavipes*, Meig. Dipt. Nord. Fr. i. 36. 8.
  9. *pallidicornis*, Meig. Dipt. Nord. Fr. i. 36. 7.
  10. *pygmæa*, Meig. Dipt. Nord. Fr. i. 37. 10.
-

Genus II. **CORDYLA.**

**CORDYLA**, Meig. Zw. i. 274 (1818); Curt.; Zett. *Mycetophila* p.?, Curt. *Pachypalpus*, Mcq.; Zett.

Corpus angustum. Ocelli duo, minuti. *Palpi basi crassi. Antennæ incrassatae, breves. Alæ angustæ, breviusculæ. Abdomen compressum. Pedes sat breves; tibiæ vix spinosæ.*

Body narrow. Ocelli two, minute, contiguous to the eyes. *Palpi thick at the base, short. Antennæ incrassated, short. Wings narrow, rather short. Abdomen compressed. Legs somewhat short; tibiæ hardly spinose, armed with rather long spurs.*

This genus much resembles *Mycetophila*; the veins of the wings have the same structure, and the species have the same habits. The sexes differ both in the form of their antennæ and the number of joints, which also varies according to the species.

1. **valida**, n. *Lutea*, crassa, alis subcinereis, pedibus validis, calcaribus sat longis, tarsis fuscescentibus. Long. 2; alar. 4 lin.

*Luteous*, stout, compact. Antennæ lanceolate, shorter than the thorax; joints short, transverse. Wings greyish, rather short; veins tawny; radial vein ending at before two-thirds of the length, cubital ending at beyond five-sixths of the length; veinlets of the præbrachial areolet forming an almost right angle, the hind one about six times the length of the fore one, and nearly half the length of the subapical vein before its fork; fork of the subanal vein very much nearer than the fork of the subapical to the base of the wing; anal vein extending to the fork of the subanal. Legs stout; spurs moderately long; tarsi brownish; hind tibiæ with very minute spines.

Rare. In the British Museum. (E.)

2. **flaviceps?** Stæg. D. D. 268. 2 (1840). *Nigricans, palpis, antennis, thoracis limbo, pectore pedibusque fulvis, alis subcinereis, halteribus testaceis, tarsis nigris.* Long. 1; alar. 2 lin.

*Blackish*. Palpi and antennæ tawny, the latter short, stout. *Thorax tawny in front, on each side, and beneath.* Wings very slightly greyish; veinlets of the præbrachial areolet forming an obtuse angle, the hind one full twice the length of the fore one, and about half the length of the subapical vein before its fork; fork of the subanal vein very much further than the fork of the subapical from the base of the wing; anal vein extending nearly to the fork of the subanal. Halteres testaceous. Legs tawny, short, stout; spurs very long; tarsi black; hind tibiæ with very minute spines; fore tibiæ much longer than the fore metatarsi.

Rare. (E. I.)

3. **fasciata?** Meig. Zw. vi. 304. 3 (1830).—*fulveola*, Hal.—*cinerrea?* Zett. *Nigro-fusca, cinereo-tomentosa, palpis, halteribus, abdominis fasciis femoribusque testaceis, antennis basi thoracisque maculis duabus*

Common, especially on the oak and on the lime-tree. (E. S. I.)

2. **pulchella**, Curt.! B. E. 645 (1837). *Ochracea, antennis fuscis, alis flavescentibus, macula costali apicali fusca, abdomine maculis fasciisque nigris, femoribus posterioribus apice tarsisque nigricantibus.* Long. 2; alar. 4 lin.

*Bright ochreous*, shining, finely pubescent. Vertex with a black spot. Antennæ brown, ochreous at the base. Metathorax with a brown spot. Wings yellowish, with a long brown mark at the apex of the costa; first and second abdominal segments with a black spol on each; third, fourth, and fifth with a black ring on the margin; sixth and seventh glossy black. Tarsi and tips of the hinder femora blackish; tibiæ brownish-ochre.

Rare; has been found by Mr. Curtis and Mr. Haliday on *Umbelliferæ*, near Killarney. (I.) In the collections of Mr. Curtis and Mr. Haliday.

3. **octomaculata**, Curt. B. E. 645 (1837). *Ochracea, vertice antennisque fuscis, thoracis vittis tribus scutelloque nigris, alis fascia fusca arcuata subapicali, abdomine nigro maculis octo lateralibus ochraceis, femoribus posterioribus apice tarsisque nigris.* Long. 2; alar. 4 lin.

*Ochreous.* Vertex brown. Antennæ brown, ochreous at the base. Thorax with three black united stripes not reaching the front. Scutellum and abdomen black. Wings with a lunate brown spot near the apex. Second, third, fourth and fifth abdominal segments with an ochreous trigonate spot on each side of the base. Tarsi and tips of hinder femora black; tibiæ dull ochreous.

Rare. In Mr. Curtis's collection. (E.)

4. **fumosa**, n. *Nigra, capite subtus, palpis, pectore, thoracis marginibus vitta dorsali testaceis, alis fuscis, halteribus coxis femoribusque testaceis, abdomine piceo.* Long.  $2\frac{1}{2}$ ; alar. 4 lin.

*Black.* Head beneath, palpi, pectus and borders of the thorax testaceous. Thorax with a testaceous dorsal stripe. Wings brown; veins black; subcostal vein about one-third of the length of the wing, united near its tip to the radial by a transversc veinlet; radial united to the cubital at some distance from its base; fork of the subanial much nearer than the base of the subapical to the base of the wing. Halteres testaceous. Abdomen piceous. Legs testaceous; tibiæ and tarsi black.

Rare. In the British Museum.

5. **bimaculata**, Meig. Kl.; Zw. i. 72. 7 (1804); Mcq.; Stæg.; Rs.; Zett. *Nigra, palpis, thoracis maculis duabus anticis, halteribus pedibusque testaceis, alis sublimpidis fascia subapicali fuscescente, abdomine ferrugineo fasciis nigris, coxis femoribusque nigro-notatis, tarsis nigris.* Long. 2; alar. 4 lin.

*Black.* Palpi testaceous. Antennæ stout, testaceous towards the base. Thorax with a large testaceous spot on each side in front.

*Wings* nearly limpid, slightly greyish along the hind border, and *with a pale brownish subapical band*; subcostal vein very short, united near its tip to the radial by a transverse veinlet; radial vein united to the cubital rather near its tip; fork of the subanal vein a little nearer than the base of the subapical to the base of the wing. Halteres testaceous. Abdomen ferruginous; hind borders of the segments black. Legs testaceous; a black mark on each coxa and femur; tarsi black.

Not common. (E. I.)

6. **gilvipes**, Hal. MSS. "Nigra, albido-hirta, antennis nigro-fuscis, alis obscure hyalinis immaculatis, vena mediastina abbreviata, tarsis fuscous. Long.  $1\frac{1}{4}$ ; alar.  $2\frac{2}{3}$  lin."—Hal. MSS.

"Black, clothed with whitish hairs. Ocelli three, almost in a line. Palpi yellow. Antennæ blackish-brown, rather thick; second joint with a long hair above. Wings obscurely hyaline, very finely pubescent; veins nearly like those of Sect. B b. Meig. Zw. i. pl. 9. f. 14; costal, subcostal, and cubito-radial veins brownish-ferruginous; the rest slender, almost colourless; cubital ending before the tip of the wing; subcostal as long as three-fourths of the cubital; connecting vein or radio-cubital vein upright, very short, opposite the middle of the subcostal vein, nearer than usual to the base of the wing; mediastinal vein straight, evanescent before the radio-cubital; præbrachial vein with a very short petiole and with long branches opposite the fork of the cubito-radial; costal vein extending towards the tip of the wing, beyond the end of the subcostal, as in *Tetragoneura*, to which this species is nearly alike in habit, and, if I am not mistaken, a variety has the connecting veinlet doubled in one wing, and thus forming a very minute areolet. Legs rather short and thick; tibiæ darker than the femora; posterior tibiæ with a rather thick row of minute spines; hind tibiæ with a few stouter spines; tarsi brownish."—Hal. MSS.

Rare. In Mr. Haliday's collection. (I.)

7. **Winthemii**, Lehm. Diss. 39 (1822); Meig.; Mcq.; Zett.; Staeg.; Rs. Testacea, antennis nigricantibus, thoracis vittis tribus abdominisque fasciis fuscis, alis limpidis interrupte trifasciatis, tarsis nigricantibus. Long.  $2\frac{1}{2}$ – $2\frac{3}{4}$ ; alar. 5– $5\frac{1}{2}$  lin.

Testaceous. Vertex ferruginous. Antennæ blackish, testaceous towards the base. Thorax with three brown stripes, the middle one divided, the lateral pair short. Wings limpid, with three imperfect and interrupted and occasionally almost obsolete grey bands; the first in the middle; the second sometimes entire, at three-fourths of the length; the third subapical; subcostal vein short, united near its tip to the radial by a transverse veinlet; radial united to the cubital at some little distance from its tip; fork of the subanal much nearer than the base of the subapical to the base of the wing. Abdomen with a black or brown band on the hind border of each segment. Tarsi blackish, except at the base; tips of the hind femora generally blackish.

Not rare in the autumn. (E.)

the base. *Thorax with three black stripes*, the middle one in advance of the others. Pectus testaceous. Wings greyish; veinlets of the præbrachial areolet forming an obtuse angle, the hind one full twice the length of the fore one, and as long as the subapical vein before its fork; fork of the subanal vein a little nearer than the fork of the subapical to the base of the wing; anal vein extending beyond the fork of the subanal. Halteres testaceous. Abdomen brown, with a testaceous band on the hind border of each segment. Legs testaceous; tarsi brown; hind tibiæ armed with minute spines and with long spurs.

Rare. (E.)

15. **pubescens**, Walk. E. M. iv. 115 (1837). *Nigra, cinereo-tomentosa, palpis, halteribus pedibusque testaceis, alis limpidis apice subcinereis, tarsis apices versus nigricantibus.* Long.  $1\frac{1}{2}$ ; alar. 3 lin.

*Black*, with hoary tomentum. Palpi testaceous. Antennæ a little longer than the thorax. Wings limpid, with greyish tips; subcostal vein short, united to the radial at its tip; radial joining the costal at less than two-thirds of the length of the wing, united to the cubital by a transverse veinlet which is nearly opposite the fork of the subapical; cubital united to the costal at some distance from the tip of the latter; fork of the subanal a little nearer than the fork of the subapical to the base of the wing. Halteres testaceous. Legs testaceous; tarsi blackish towards the tips.

Not rare. (E.)

16. **diversa**, n. *Nigra, palpis, halteribus, abdominis segmentorum marginibus posticis pedibusque testaceis, thoracis lateribus anticis subfulvis, alis subcinereis, tarsis fuscis.* Long. 2; alar. 4 lin.

*Black*. Palpi testaceous. Antennæ testaceous at the base. *Thorax slightly tawny on each side in front*. Wings very slightly greyish; subcostal vein joining the costal before one-third of the length of the wing, not united to the radial; radial ending at about three-fourths of the length, joined to the cubital by a transverse veinlet which is nearly opposite the fork of the subapical; cubital joining the costal at a short distance from the tip of the latter; fork of the subapical vein very much further than the fork of the subanal from the base of the wing; anal vein not extending to the fork of the subanal. Halteres testaceous. *Hind borders of the abdominal segments testaceous*. Legs testaceous; tarsi brown.

Rare. (E.)

17. **defecta**, n. *Mas, nigra, palpis, abdominis apice pedibusque testaceis, alis sublimpidis, halteribus testaceis apice nigris, trochanteribus nigro-variis, tarsis nigricantibus.* Long. 1; alar. 2 lin.

*Male*. Black. Palpi testaceous. Antennæ submoniliform, a little longer than the thorax. Wings nearly limpid; subcostal vein joining the costal at a little before one-third of the length of the wing, united by a little transverse veinlet with the radial at some distance from its tip; radial joining the costal before two-thirds of the length, united

with the cubital by a veinlet which is a little beyond the base of the subapical vein; eubital joining the eostal near the tip of the latter; subapical and subanal slight, the former forked near its base. Halteres testaceous, with black knobs. Abdomen testaceous at the tip. Legs testaceous; trochanters partly black; spurs long; tarsi blackish, minutely setose beneath.

Rare. (E.)

---

### Genus V. BOLETINA.

BOLETINA, Stæg. D. D. (1840); Zett. *Mycetophila* p., Meig. *Leia* p., Meig. *Leptomorphus* p., Walk.

Corpus graile. Oeuli ovati. Oeelli tres, intermedius minimus. Palpi areuati, 4-articulati. Antennæ graeiles, filiformes, subeocompressæ, fere nudæ, 16-articulatæ. Thorax brevis. Alæ sat latae; *vena subcostalis costæ dimidium fere attingens, cubitalis e venulis transversis areolæ præbrachialis orta.* Abdomen longum, gracile, basim versus subcontractum. Pedes graeiles.

Body slender. Eyes oval. Oeelli 3, the middle one very small. Proboscis slightly elongated. Palpi curved, four-jointed. Antennæ slender, filiform, slightly compressed, nearly bare, sixteen-jointed. Thorax short. Wings moderately broad; eostal vein ending at hardly in front of the tip of the wing; *subcostal nearly half the length of the wing;* radial ending at a little before five-sixths of the length; eubital joining the tip of the eostal, springing from the angle formed by the transverse veinlets which close the præbrachial areolet; subapical and subanal veins forked or simple; anal vein distinct. Halteres rather short. *Abdomen long and slender, somewhat straitened towards the base.* Legs slender, rather long; tibiæ beset by a few very minute bristles; spurs moderately long. *Male.* Antennæ about twice the length of the thorax. Abdomen cylindric. *Fem.* Antennæ hardly longer than the thorax. Abdomen subfusiform.

The *Boletinæ* frequent woods, and in their habits much resemble the *Mycetophilæ*, but differ in their more slender structure, and in the greater length of the subcostal vein. *Gnoriste* is nearly allied to them, but is distinguished by the length of its proboscis.

Synopsis of the species:—

- a.* Subapical vein and subanal vein forked.
- b.* Forks of the veins at an equal distance from the base of the wing.
- b b.* Fork of the subanal vein nearer than the fork of the subapical to the base of the wing. Species 1-3.
- b b b.* Fork of the subanal vein further than the fork of the subapical from the base of the wing. Species 4.
- a a.* Subapical vein not forked. Species 5.
- a a a.* Subapical vein and subanal vein not forked.

fourth twice as long, slender, flexible. Antennæ filiform, compressed, sixteen-jointed, about half the length of the body, or rather shorter. Thorax short. Wings moderately broad; subcostal vein slightly curved forward towards its tip, ending at very little beyond half the length, often united with the costal, connected by a transverse veinlet near its tip with the radial; radial straight, ending at about seven-tenths of the length; cubital springing from the radial at before the middle of the wing, near which it forms a hardly obtuse angle at its junetion with the præbrachial transverse, and is thence straight to the end, which is at the tip of the wing; subapical forked at beyond the middle of the wing; fore fork ending at some little distance behind the tip of the wing; subanal forked at about one-third of the length of the wing, its forks straight; anal ceasing at a short distance from the posterior margin; humeral veinlet very near the base; *areolets* twelve—the humeral, the subcostal, the radial, the præbrachial, the pectoral, *two cubital*, the subapical, two externo-medial, the anal, and the axillary; radial and cubital veins each divided by a transverse veinlet; posterior margin forming a slight acute angle at full thrice the length of the humeral areolet from the base. Halteres rather short. Abdomen more than twice the length of the thorax, somewhat straitened towards the base. Legs long, slender; coxae and femora slightly hairy; tibiæ slightly setose; spurs of moderate length. *Male*. Antennæ about half the length of the body. Abdomen nearly cylindrical. *Fem.* Antennæ much less than half the length of the body. Abdomen elongate-fusiform.

The *Sciophila* frequent herbage and leaves of trees in shady woods, and in general appearance much resemble the *Mycetophilæ*. The two cubital areolets in their wings at once distinguish them from all the other genera of this Family, and the variations of the form of the first cubital areolet will serve to arrange them in the following groups:—

- a.* Subcostal vein of moderate length.
  - b.* First cubital areolet thrice longer than broad. Species 1.
  - b b.* First cubital areolet nearly thrice longer than broad. Species 2.
  - b b b.* First cubital areolet more than twice longer than broad. Species 9, 12, 22.
  - b b b b.* First cubital areolet twice longer than broad. Species 5-7, 10, 18, 25.
  - b b b b b.* First cubital areolet nearly twice longer than broad. Species 3, 8, 21.
  - b b b b b b.* First cubital areolet much longer than broad. Species 4, 13-15.
  - b b b b b b b.* First cubital areolet a little longer than broad. Species 11, 16, 26.
  - b b b b b b b b.* First cubital areolet not longer than broad. Species 17, 19, 20.
- a a.* Subcostal vein very short. Species 23, 24.

In the sixteen following species the fork of the subapical vein is much further than the fork of the subanal from the base of the wing.

1. **tenuis**, n. Fulva, palpis halteribus pedibusque testaceis, antennis thoracisque vittis tribus nigrieantibus, alis sublimpidis. Long.  $2\frac{1}{2}$ ; alar. 4 lin.

Tawny, slender. Vertex black. Palpi testaceous. Antennæ blackish, testaceous at the base. Thorax with three blackish stripes, the middle one extending to the fore border, the lateral pair short. Wings nearly limpid; the transverse veinlet from the subcostal vein opposite the middle of the first cubital areolet, which has slightly acute fore angles, and slightly obtuse hind angles, the outer side slightly undulating. Halteres testaceous. Legs testaceous, long, very slender; hind tibiæ with very minute spines and rather short spurs.

Rare. (E.)

2. **hyalinata**? Meig. Zw. vi. 295. 15 (1830); Stæg.; Zett. Testacea, vertice, thoraeis diseo antennisque nigris, alis subcinereis, abdomine fusco, segmentorum marginibus posticis testaceis, tarsis nigricantibus. Long.  $2\frac{1}{2}$ -3; alar.  $5\frac{1}{2}$ -6 lin.

Testaceous. Vertex and disc of the thorax black. Antennæ black, testaceous at the base. Wings greyish; subcostal veinlet opposite the middle of the first cubital areolet; the latter rather large, with slightly acute fore angles, and equally obtuse hind angles; eubital vein curved. Abdomen brown; hind borders of the segments testaceous. Tibiæ darker than the femora; tarsi blackish; hind tibiæ with very minute spines and rather short spurs.

Not common. (E.)

3. **marginata**, Meg.; Meig. Zw. i. 249. 8 (1818); Stæg.; Rs.; Zett.—*unimaculata*? Mcq. Testacea, vertice, antennis, thoracisque vittis tribus nigris, alis subcinereis, *areola cubitali prima obscura*, abdomine nigro, fasciis testaceis, tarsis fuscis. Long.  $2\frac{1}{2}$ -3; alar.  $5\frac{1}{2}$ -6 lin.

Testaceous. Vertex black. Antennæ black, testaceous towards the base. Thorax with three black or brown stripes, the lateral pair short. Wings very slightly greyish; transverse veinlet from the subcostal vein opposite the middle of the *first cubital areolet*, which is *clouded* and rather large; fore angles slightly acute, hind angles slightly obtuse. Abdomen black, with a testaceous band on the hind border of each segment. Tarsi brown; hind tibiæ with minute spines and moderately long spurs.

Not rare. (E. I.)

4. **fasciata**, Fries; Zett. I. L. 858. 3 (1840); Stæg. Testacea, vertice, antennis thoracisque vittis tribus nigris, alis subeinerces, abdomine nigro fasciis testaceis, tarsis fuscis. Long. 2-3; alar.  $4\frac{1}{2}$ -6 lin.

Testaceous. Vertex black. Antennæ black, testaceous at the base. Thorax with three black stripes, the lateral pair short. Wings slightly

12. **ferruginea**, Meig. Z. i. 249. 9 (1818). *Testacea*, vertiee, antennis thoraeisque vittis tribus nigris, alis subeinereis, abdomine fasciis fuseis, tarsis fuseo-entibus. Long.  $1\frac{1}{2}$ -2; alar. 3-4 lin.

*Testaceons.* Vertex black. Antennæ black, testaceous at the base, not longer than the thorax in the female. Thorax with three black stripes, the lateral pair short. Wings very slightly greyish; subcostal vein not joining the costal; its veinlet a little beyond the middle of the first cubital areolet; the latter is rather large, with slightly acute fore angles and slightly obtuse hind angles. *Abdomen with a brown band on the hind border of each segment.* Tarsi brownish; hind tibiæ with minute spines and rather short spurs.

Not common. (E.)

13. **ruficollis?** Zett. D. S. xi. 4121. 17 (1852). *Testacea*, antennis nigris, alis limpidis, abdominis suturis apieque nigricantibus, tarsis fuseis. Long.  $1\frac{1}{2}$ -2; alar. 3-4 lin.

*Testaceous.* Antennæ black, testaceous at the base. Wings limpid; subcostal vein not joining the costal; its veinlet before the middle of the first cubital areolet; the latter is of moderate size, with acute fore angles and obtuse hind angles. Sutures and tip of the abdomen blackish. Tarsi brown; hind tibiæ with minute spines and moderately long spurs.

Not common. (E.)

14. **punctata?** Latr. G. C. iv. 261 (1810); Meig. *Fulva*, vertiee nigro, palpis, halteribus pedibusque testaceis, antennis tarsisque nigricantibus, *thoracis disco fusco*, alis subeinereis. Long. 2; alar. 4 lin.

*Tawny.* Vertex black. Palpi testaceous. Antennæ blackish, testaceous at the base. *Disc of the thorax dark brown.* Wings greyish; subcostal vein not joining the costal; its veinlet beyond the middle of the first cubital areolet; the latter is of moderate size, with the basal angles nearly rectangular, the fore apical angle acute, the hind apical angle obtuse. Halteres testaceous. Legs testaceous, rather stout; tarsi blackish; hind tibiæ with minute spines and moderately long spurs.

Rare. (E.)

15. **trilineata?** Zett. I. L. 859. 6 (1840), var.? *Testacea*, vertice nigrieante, antennis *thoracis vittis tribus tarsisque fuscis*, alis sublimpidis, abdomine ferrugineo, trochanteribus fuso-notatis. Long. 2; alar. 4 lin.

Var.?—*Testaceons.* Vertex blackish. Antennæ brown; first, second, and third joints testaceous. *Thorax with three remote brown stripes;* lateral pair short. Wings nearly limpid; subcostal vein not joining the costal; its veinlet opposite the middle of the first cubital areolet; the latter is of moderate size, with acute fore angles and obtuse hind angles. *Abdomen pale ferruginous.* Trochanters with a brown spot on each; tarsi brown; hind tibiæ with minute spines and moderately long spurs.

Not common. (E.)

16. **lutea**, Mcq. D. i. 139. 10 (1826); Meig.; Stæg.; Zett. ? *Lutea*, subitus testacea, vertice nigro, antennis fuscis, alis sublimpidis, abdomine fulvo, tarsis fuscescentibus. Long. 2; alar. 4 lin.

*Luteous*, testaceous beneath. Vertex black. Antennæ brown, testaceous at the base. Wings nearly limpid; first cubital areolet very small; basal fore angle and hind apical angle slightly acute; the other two slightly obtuse. Abdomen tawny; tarsi brownish.

Not common. (E.)

17. **rufilatera**, Walk. E. M. iv. 115 (1837). *Nigra*, palpis, thoracis maculis duabus anticus, abdominis lateribus pedibusque fulvis, alis subcincris, halteribus testaceis, tarsis fuseis. Long.  $1\frac{3}{4}$ ; alar.  $3\frac{1}{2}$  lin.

*Black*. Palpi tawny. Antennæ tawny at the base. *Thorax with a tawny spot on each side in front*. Wings slightly greyish; the transverse veinlet from the subcostal vein nearer than the first cubital areolet to the base of the wing; cubital areolet very small, almost square. Halteres testaceous. *Abdomen tawny on each side except towards the tip*. Legs tawny; tarsi brown; hind tibiæ with minute spines and rather long spurs.

Rare. In the British Museum. (E.)

18. **hirta**, Hoffm.; Meig. Zw. i. 251. 12 (1818); Mcq.; Stæg.; Zett. — *pilosula*, Zett. I. L., var. — *nitidicollis*, Meig., var.? *Nigra*, palpis, halteribus pedibusque testaceis, alis subcincris, tarsis fuscis basi testaceis, femoribus postieis basi apiceque tibiisque postieis apice nigricantibus. Long.  $1\frac{1}{2}$ —2; alar. 3—4 lin.

*Black*. Palpi testaceous. Antennæ longer than the thorax. Wings greyish; first cubital areolet of moderate size, about twice longer than broad, hardly widening outward, fore basal angle slightly acute, hind basal angle slightly obtuse; apical angles almost right angles; fork of the subapical vein much nearer than the fork of the subanal to the base of the wing. Halteres testaceous. Legs testaceous; tarsi brown, testaceous at the base; hind femora blackish at the base and at the tips; hind tibiæ with black tips.

Not rare. (E.)

19. **ochracea**, Steph. MSS. *Testacea*, pubescens, robusta, antennis fuscis, alis limpidis, pedibus validis breviuseculis, tibiis spinosis, tarsis fuscescentibus. Long.  $2\frac{1}{2}$ ; alar. 5 lin.

*Testaceous*, pubescent, rather stout. Antennæ brown, testaceous at the base. Wings limpid; subcostal veinlet before the first cubital areolet, the latter very small, with two basal right angles; the fore apical angle acute, and the hind apical angle obtuse; fork of the subapical vein much nearer than the fork of the subanal to the base of the wing. Abdomen mostly tawny above. Legs rather short and stout; tarsi brownish; posterior tibiæ thickly beset with stout spines.

Rare. In the British Museum. (E.)

stout; subcostal vein not extending much beyond the areolet, connected with the radial before the areolet, which is very small; fork of the præbrachial vein with a very short petiole, almost sessile; pobra-chial vein entire. Halteres with a blackish-brown knob. *Abdomen brownish.* Posterior tibiæ with short, but distinct little spines. The whole stature with the antennæ and legs shorter than in *S. rufa*; veins of the wings stouter, and differently arranged.

Very rare. Has been found once in Tullymore Park, County Down. In Mr. Haliday's collection. (I.)

---

### Genus VII. **TETRAGONEURA.**

**TETRAGONEURA**, Winn. Ent. Zeit. Stett. vii. 18 (1846). *Sciophila* p., Meig.; *Curt. Mycetophila* p., Meig.

Corpus gracile, elongatum. Caput parvum. Oculi rotundi. Ocelli tres, lineam paullulum curvatam efficientes, intermedius paullo minor. Proboscis brevis. Palpi exserti, incurvi, 4-articulati. Antennæ filiformes, porrectæ, subcompressæ, 6-articulatæ, corporis dimidio non longiores; articulus primus cyathiformis; secundus cupuliformis; tertius et sequentes cylindrici. Thorax ovatus. Alæ obtusæ, in-cumbentes, parallelæ, sat latæ, areolis duabus cubitalibus. Abdomen segmentis 7. Pedes longiusculi; coxæ elongatæ; femora compressa; tibiis apice calcaratæ, posticæ spinosæ. *Mas.* Abdomen cylindricum, forcipe brevi. *Fœm.* Abdomen subcompressum, acumi-natum.

Body slender, elongated. Head small, round; vertex broad. Eyes round. *Ocelli three, forming a curved line on the front, the middle one rather smaller than the others.* Proboscis short. Labium short, fleshy, bifid, and hairy in front. Palpi four-jointed, porrect, curved; first joint very small; fourth long, filiform. Antennæ sixteen-jointed, por-rect, curved; first and second joints bristly; first cyathiform; second elongate, cyathiform; third and following joints short, cylindrical. Thorax oval, convex. Scutellum small, obtuse behind, with long bristles. *Wings* almost oval, obtuse, incumbent, parallel, longer than the abdomen; subcostal vein very short; radial ending at much beyond half the length of the wing; cubital ending at much before the tip of the wing; subapical forked at beyond the middle of the wing; fore fork ending at the tip of the wing; subanal ending nearer the base of the wing; anal not extending to the border of the wing; *two cubital areolets.* Abdomen with seven segments. Legs rather long; coxæ elongated; femora compressed; tibiæ armed with spurs, the hind pair with lateral spines. *Male.* Abdomen cylindrical, with short forceps at the tip. *Fœm.* Abdomen slightly compressed, acuminated.

*Tetragoneura* is nearly allied to *Sciophila*, but the two genera may be distinguished by the following characters, and by some

differences in the wing-veins. In *Sciophila* the head is almost conical; the eyes are not quite circular, generally almost reniform; the ocelli form a very minute triangle, the middle one is very small, and the joints of the antennæ are somewhat compressed. In *Tetragoneura* the head is round, flat above; the eyes are circular; the ocelli are of nearly equal size, and are disposed in a curved line; and the joints of the antennæ are cylindric.

**1. hirta**, Winn. Ent. Zeit. Stett. vii. 19 (1846).—*dissimilis*, Zett. *Mas et Fœm.* nigra, proboscide, palpis et antennarum articulis primo et secundo flavis, thorace nigro-cinerco, alis hyalinis, vena subcostali in radiali exente ante areolam, furca venæ pobrachialis prope basim alæ, coxis femoribusque albo-flavis, tibiis tarsisque fuscis; *Mas*, abdomine nigro nitido, segmentis basalibus subtus flavis; *Fœm.* abdomine flavo, vitta dorsali fasciisque nigris. Long.  $1\frac{1}{2}$ ; alar. 3 lin.

*Male and Fem.* Black, clothed with whitish hairs. Proboscis and palpi yellow. *First and second joints of the antennæ yellow.* Thorax blackish-grey, beset with long whitish-yellow bristles. Wings hyaline; costal, radial, and cubital veins brown, the rest nearly colourless; *subcostal vein ending in the radial before its middle*, at a distance before the areolet equal to the length of the latter; areolet oblong, almost longer than the last segment (following it) of the radial vein; fork of the pobrachial vein opposite the transverse cubital vein, or the apex of the areolet; fork of the pobrachial retracted almost to the base of the wing. Halteres white. Coxæ and femora whitish-yellow; second joint of the coxæ and hind femora with black tips, the latter with a black streak at the base on the under side; tibiæ and tarsi brown. *Male.* Abdomen black, shining, clothed with whitish-yellow hairs; first and second, and occasionally the third of the ventral segments yellow. *Fem.* Abdomen yellow; segments with a black dorsal stripe and black bands; sixth and seventh segments wholly black.

Very rare. Has been found in Down, Ireland. In Mr. Halliday's collection. (I.)

**2. sylvatica**, Curt. B. E. xiv. pl. 641 (1837);—*distincta*, Winn. Nigra, proboscide, palpis et antennarum articulo secundo flavis, thorace nigro-cinereo, alis hyalinis, furca venæ pobrachialis prope medium alæ, vena subcostali obsolete, coxis femoribusque albo-flavis, tibiis tarsisque fuscis; *Mas*, abdomine nigro nitido, segmentis basalibus subtus flavis; *Fœm.* abdomine nigro, ventre flavo. Long.  $1\frac{1}{2}$ ; alar. 3 lin.

*Male and Fem.* Black. Proboscis, palpi, and second joint of the antennæ yellow. Thorax blackish-grey, beset with long whitish-yellow bristles. Wings obscurely hyaline; veins towards the costa brownish-ferruginous; subcostal vein obsolete; areolet minute, oblong; fork of the pobrachial vein opposite to the pobrachial median transverse vein, or to the base of the areolet; fork of the pobrachial rather nearer to the base of the wing; its anterior branch equal to the common

Rare. June, Tullymore Park. The larva inhabits decayed wood. In the collection of Mr. Haliday. (I.)

---

### Genus IX. LEPTOMORPHUS.

LEPTOMORPHUS, Curt. B. E. 365 (1831).

*Mas.* Corpus gracile. Caput parvum. Palpi capitis longitudine, 4-articulati. Oculi ovati. Ocelli duo, distincti. Antennæ filiformes, 16-articulatæ, corporis dimidio breviores. Thorax brevissimus. *Alæ angustæ; vena cubitalis non furcata; subanalis furcata.* Halteres breviusculi. Abdomen subcompressum, apicem versus subincrassatum, thorace quadruplo longior. Pedes longi, graciles; *tibiæ spinis minimis calcaribusque longis.*

*Male.* Body slender. Head small. Palpi four-jointed, as long as the head; fourth joint long and slender. Eyes oval. Ocelli two, distinct. Antennæ filiform, sixteen-jointed, less than half the length of the body. Thorax very short. *Wings* narrow; costal vein ending at very little in front of the tip of the wing; subcostal ending at a little before half the length, connected near its tip with the radial by a very short transverse veinlet, which is very near another between the radial and the cubital; radial ending at beyond five-sixths of the length; cubital united with the tip of the costal, not forked; *fork of the subapical vein much beyond the fork of the subanal, which is nearly opposite the transverse veinlets;* anal vein extending a little beyond the fork of the subanal. Halteres rather short. Abdomen slightly compressed, rather thickened towards the tip, full four times the length of the thorax. *Legs* long, slender; *tibiæ with very minute spines and long spurs.*

1. **Walkeri**, Curt. B. E. 365 (1831). Testaceus, antennis, thoracis vittis tribus, abdominis fasciis tarsisque fuscis, alis sublimpidis macula discali fusca apicibus cinereis. Long. 5; alar. 7 lin.

Testaceous. Antennæ brown, testaceous towards the base. Thorax with three brown stripes, which are united hindward. Wings nearly limpid, with grey tips and with a brown spot at the tip of the præ-brachial arcolet. Abdomen brown towards the tip; hind borders of the segments brownish. Tarsi brown.

Not common. (E.)

---

### Genus X. DIADOCIDIA.

DIADOCIDIA, Ruthe, Isis xi. 1210 (1831); Winn. *Mycetobia* p., Meig. *Macroneura*, Mcq. *Sciara* p., Zett.

Corpus lineare, breviusculum, ferc nudum. Caput rotundum, supra

depressum. Facies pilosa. Oculi reniformes. Ocelli tres, fere æquales ; intermedius anticus, lateralibus vix minor. Palpi 4-articulati, graciles. Antennæ latiusculæ, fere cylindricæ, 17-articulatae, corporis dimidio non longiores ; articulus septimus-decimus minimus. Thorax subrotundus, convexus. Scutellum parvum. Alæ sat latæ, pubescentes ; *vena subanalis simplex*. Halteres breves. Abdomen cylindricum, segmentis 7, thorace multo longius. Pedes graciles, sat breves, subpubescentes ; femora valida ; tibiæ graciles, ealeralatæ, *posticæ spinis nonnullis minimis*.

Body linear, nearly bare, rather short. Head round, flat above. Face pilose. Eyes reniform. Ocelli three, the middle one in front, hardly smaller than the others. Palpi four-jointed, slender. Antennæ seventeen-jointed, rather stout, almost cylindrical, not more than half the length of the body ; seventeenth joint very small. Thorax nearly round, convex. Scutellum small. Wings moderately broad, pubescent, parallel in repose ; subcostal vein ending at much less than half the length of the wing ; radial springing from the subcostal near its base, ending at a little in front of the tip of the wing ; cubital and subapical long, springing from an angular transverse veinlet, the latter forked at a little before half its length ; *subanal simple* ; anal reaching the border. Halteres short. Abdomen much longer than the thorax, cylindric, with seven segments. Legs rather short, slightly pubescent ; femora stout ; tibiæ slender, armed with spurs at the tips ; *hind tibiæ with some slender and very short lateral spines*.

1. **ferruginea**, Meig. Zw. vi. 294 (1830) ; Winn.—*flavicans*, Ruthe.—*Wintheimi*, Mcq.—*testacea*, Zett. Tota ferruginea, alis fulvescentibus, tarsis fuscis. Long.  $1\frac{1}{2}$ ; alar. 3 lin.

Rare. Has been found by Mr. Haliday at Killarney. (I.)

### Genus XI. MYCETOBLA.

MYCETOBLA, Meig. Zw. i. 229 (1818) ; Meq. ; Winn.

Corpus lineare, breviuseulum, fere nudum. Caput rotundum, supra depressum. Oculi reniformes. Ocelli tres ; intermedius anticus, parvus. Palpi 4-articulati. Antennæ latiusculæ, 17-articulatae, corporis dimidio non longiores ; articulus septimus-decimus minimus. Thorax fere ellipticus. Alæ sat latæ ; *vena subanalis furcata*. Halteres breves. Abdomen thorace multo longius. Pedes latiusculi, sat breves, subpubescentes ; *tibiæ calcaribus minimis, non spinosæ*.

Body linear, nearly bare, rather short. Head round, flat above. Eyes reniform. Ocelli three ; the middle one small, in front. Palpi four-jointed. Antennæ stout, sixteen-jointed, rather less than half the length of the body. Thorax nearly elliptical. Wings moderately broad ; subcostal vein ending at a little beyond two-thirds of the length of the wing. Radial emerging from the subcostal at half the length of the

*d d d.* Body testaceous. Species 22, 23.  
*c c.* Wings imperfect. Species 24.

1. **Thomæa**, L. S. N. ii. 976 (1767); F.; Gmel.; Panz.; Latr.; Meig.; Mcq.; Gim.; Stæg.; Zett.; Guér.—*lateralis*, Meg.; Meig. Atra, antennis nigris, abdominis lateribus luteo vittatis. Long. 3; alar. 6 lin.

Deep black. Wings black; radial vein extending beyond the fork of the subapical, and much beyond half the length of the wing. Abdomen with a luteous stripe on each side.

Common. For the habits of the larva, see Guérin (Ann. Soc. Ent. Fr. 2<sup>me</sup> Sér. iv. Bull. viii.), and other authors. (E. S. I.)

2. **Morio**, F. E. S. iv. 275. 18 (1792); Meig.; Mcq.; Zett.; Gim.; Stæg.—*florilega*, Meig. Kl.—*forcipata*, F.; Gmel. Nigra, alis nigricantibus, pedibus piceis. Long. 2; alar. 4 lin.

Black. Wings blackish, darkest along the costa; medial vein ending at much beyond the fork of the subapical, and much beyond half the length of the wing.

Common. (E. S. I.)

3. **fuscipes?** Meig. Zw. i. 280. 5 (1818); Zett.; Gim.; Stæg. Nigra, alis cinereis, halteribus testaceis apice nigris, pedibus piceis, femoribus tibiisque anticus testaceis. Long. 1½; alar. 3 lin.

Black. Wings dark grey; radial vein extending beyond the fork of the subapical and much beyond half the length of the wing. Halteres testaceous, with blackish knobs. Legs piccos; fore femora and fore tibiæ testaceous.

Common. (E. S. I.)

4. **brunnipes**, Meig. Zw. i. 286. 25 (1818); Mcq.; Gim.; Rs.; Zett. Picca, gracilis, capite antennisque nigris, thorace vittis tribus cinereis, alis cinereis, halteribus testaceis apicem fuscescentibus, pedibus testaceis, tarsis nigricantibus. Long. 1½–2; alar. 3–4 lin.

Piceous, slender. Head and antennæ black, the latter slender, of moderate length. *Thorax with three cinereous stripes.* Wings grey; veins blackish; radial vein ending at very much beyond half the length of the wing, and a little beyond the fork of the subapical; subapical and hinder veins distinct, the former pale before its fork. Halteres testaceous, with brownish tips. Legs testaceous, rather long; tibiæ darker than the femora; tarsi blackish.

Generally distributed. (E. S. I.)

5. **nitidicollis**, Mcg.; Meig. Zw. i. 281. 8 (1818); Mcq.; Zett.; Stæg. Nigra, thorace nitido, alis cinercis, halteribus testaceis apice nigris, pedibus testaceis, tarsis nigricantibus. Long. 1–1½; alar. 2–3 lin.

Black. *Thorax shining.* Wings grey; veins blackish; radial vein extending a little beyond half the length of the wing, and very little beyond the fork of the subapical. Halteres testaceous with black knobs. Legs testaceous; trochanters and tarsi blackish.

Not common. (E.)

6. **caudata**, Walk. C. D. B. M. i. 106 (1848). *Nigra*, nitens, alis sublimpidis, halteribus pedibusque testaceis, trochanteribus tarsisque nigricantibus; *Fœm.* abdomen longissimo. Long. 3; alar. 4 lin.

*Fœm.* Black. Thorax shining. Wings nearly limpid; radial and cubital veins blackish, the others pale; radial vein extending beyond half the length of the wing and a little beyond the fork of the subapical vein. Halteres and legs testaceous. Abdomen much elongated, about six times the length of the thorax. Trochanters and tarsi blackish.

Rare. In the British Museum. (E.)

7. **pallipes**, F. E. S. iv. 248. 69 (1792); Mcig.; Gim. *Nigra*, alis sublimpidis, venis nigricantibus, halteribus pedibusque testaceis, trochanteribus tarsisque nigricantibus. Long.  $1\frac{1}{2}$ -2; alar. 3-4 lin.

*Black.* Wings nearly limpid; veins blackish; subapical vein pale before its flexure; radial extending to the fork of the subapical, and much beyond the half of the length of the wing. Halteres and legs testaceous; trochanters and tarsi blackish.

Common. (E. I.)

8. **hyalipennis**, Meig. Zw. i. 285. 21 (1818); Gim.; Stæg.; Zett. *Picea, thorace vittis cinereis*, alis sublimpidis, venis nigricantibus, halteribus pedibusque testaceis, tarsis nigricantibus. Long. 1; alar. 2 lin.

*Piceous.* *Thorax with cinereous stripes.* Wings nearly limpid; veins blackish; subapical vein pale before its fork; radial vein extending to the fork of the subapical, and beyond half the length of the wing. Halteres and legs testaceous; tarsi blackish.

Common. (E. S. I.)

9. **præcox**, Meig. Zw. i. 279. 4 (1818); Mcq.; Stæg.; Zett. *Nigra*, alis fuscis, venis nigris, halteribus abdomine pedibusque piceis. Long.  $1\frac{1}{2}$ ; alar.  $3\frac{1}{2}$  lin.

*Black.* Antennæ rather short and stout. Wings brown; veins black; radial vein ending at beyond half the length and very little before the fork of the subapical; subapical and subanal veins distinct. Halteres, abdomen and legs piceous. Legs rather stout.

Common. (E. S. I.)

10. **fuscipennis**, Mcig. Zw. i. 282. 11 (1818); Stæg.; Zett. *Nigra*, alis cincreis, venis nigris, halteribus pedibusque piccis. Long. 1; alar.  $2\frac{1}{2}$  lin.

*Black.* Antennæ rather stout, pubescent. Wings grey; veins black; præbrachial vein ending at about half the length of the wing, and a little before the fork of the subapical vein. Halteres and legs piceous.

Not common. (E.)

11. **vitripennis?** Hoffm.; Meig. Zw. i. 281. 9 (1818); Mcq.; Gim. *Nigra, gracilis, mediocris*, alis sublimpidis, venis nigris, halteribus pedibusque fuscis, tarsis nigricantibus. Long. 1; alar. 2 lin.

22. **pallida**, n. Testacea, *sæt gracilis*, capite antennisque nigris, alis limpidis, venis pallidis, tarsis nigricantibus. Long.  $\frac{1}{2}$ ; alar. 1 lin.

Testaceous, *rather slender*. Head and antennæ black. Wings limpid; veins pale; radial vein much shorter than half the length of the wing, and not extending near to the fork of the subapical. Tarsi blackish.

Rare. (E.)

23. **compressa**, Walk. C. D. B. M. i. 110 (1848). Testacea, *gracillima*, capite antennisque nigris, alis limpidis, venis pallidis, tarsis fuscis; *Fœm.* abdomine elongato. Long.  $1\frac{1}{4}$ ; alar.  $1\frac{1}{2}$  lin.

Testaceous, *very slender*. Head black. Antennæ black, as long as the thorax. Wings limpid; veins pale; radial rather less than half the length of the wing, not extending to the fork of the subapical. Abdomen thrice the length of the thorax. Tarsi brown.

Rare. In the British Museum. (E.)

24. **brevipennis**, Walk. C. D. B. M. i. 110 (1848). Testacea, capite antennisque nigris, alis minimis, abdominis segmentis nigro-fasciatis, tarsis fuscis. Long.  $\frac{3}{4}$ ; alar.  $\frac{3}{4}$  lin.

Testaceous. Head and antennæ black. Wings very short and narrow. Hind borders of the abdominal segments blackish. Tarsi brown.

Rare. In the British Museum, and in the collection of Mr. Haliday. (E. I.)

---

### Genus XIII. **EPIDAPUS**.

**EPIDAPUS**, Haliday, Ins. Brit. Dipt. i. 7 (1851). *Chionea* p., Hal. Curt. Guide, 1164, b.

Thorax e supra visus quasi conicus, postice valde compressus. *Alæ et halteres nulla*. Abdomen apud medium incrassatum, apice attenuatum decurvum; oviductus valvulis duabus ordinariis linearibus obtusis pubescentibus liberis.

Thorax much compressed behind, so as to seem conical from above. *Wings and halteres wholly obsolete*. Abdomen incrassated in the middle; tip attenuated, decurved, furnished with the ordinary two linear obtuse pubescent and free valves of the ovipositor.

1. **venaticus**, Hal. Curt. Guide, 1164<sup>b</sup>. 1 (1837). Nigra, gracilis, pedibus testaceis. Long.  $\frac{3}{4}$  lin.

Black, slender. Legs testaceous.

Rare. Holywood, near Belfast. In Mr. Haliday's collection. (I.)

---

## Genus XIV ZYGONEURA.

ZYGONEURA, Meig. Zw. vi. 304 (1830); Mcq.; Zett.

Corpus parvum. Caput parvum. Proboscis prominula. Labium bilobum. Oculi reniformes. *Ocelli tres, medius minimus, antepositus.* Palpi triarticulati. *Antennæ 16-articulatæ, moniliformes.* Thorax subellipticus. *Alæ immaculatæ, venæ cubitalis et subanalis simplices, vena subapicalis furcæ valde arcuatæ.* Pedes non elongati; *tibiæ spinis et calcaribus nullis.* Mas. *Antennæ verticillato-pilosæ, articulis petiolatis.* Fœm. Antennæ pubescentes, articulis approximatis.

Body small, black. Head small. Proboscis somewhat prominent. Labium bilobed. Eyes reniform. *Ocelli three, the middle one in front, very small.* Palpi three-jointed, curved downward. *Antennæ sixteen-jointed, moniliform.* Thorax nearly elliptical. Wings rather narrow, unspotted; costal vein ending at the tip of the wing; subcostal vein rudimentary; radial vein not extending to one-third of the length of the wing; *cubital simple, ending near the tip; forks of the subapical vein much curved, especially the fore one; subanal vein simple;* anal vein much curved downward. Halteres rather long. Abdomen moderately long. Legs not long; coxae rather large; *tibiæ with no spines nor spurs.* Male. *Antennæ verticillate-pilose; joints petiolated.* Fem. Antennæ pubescent; joints sessile.

This genus resembles *Cecidomyia* in the structure of its antennæ; in other characters it is nearly allied to *Sciara*.

1. **sciarina**, Wirthem; Meig. Zw. vi. 305. 1 (1830); Mcq.; Zett. Nigra, nitens, alis sublimpidis, venis nigricantibus, halteribus pedibusque testaceis, tarsis nigricantibus. Long. 1; alar. 2 lin.

Black. Thorax shining. Wings nearly limpid; veins blackish; subapical vein pale before its fork. Halteres and legs testaceous; tarsi blackish.

Not common. (E. S.)

## Genus XV. LESTREMIA.

LESTREMIA, Mcq. D. N. (1825); Meig. Zw. vi.; Loew; Zett. *Ti-pula p.*, F. E. S. *Chironomus p.*, F. S. A. *Sciara p.*, Meig. Zw. i. *Diamesa*, Meig. Zw. vi. in Tab.

Corpus gracile. Oculi emarginati. *Ocelli nulli.* Palpi breves. *Antennæ graciles, 16-articulatæ.* Thorax subellipticus. *Alæ pubescentes; vena radialis brevis; cubitalis et subanalis simplices; subapicalis furcata.* Abdomen oblanccolatum. Pedes graciles, longiusculi, *spinis calcaribusque nullis.* Mas. *Antennæ moniliformes, verticillato-pilosæ, sat longæ.* Fœm. Antennæ submoniliformes, pilosæ, breves. Body slender. Palpi short. Eyes emarginate. *Ocelli none.* An-

*sixteen-jointed, verticillate-pilose*, about as long as the wings ; first and second joints contiguous, the rest disjoined by a petiole formed by the constricted apex of the joints (the last excepted). Palpi pendulous, not so long as the fore coxae, with three joints appearing externally, which are oblong-ovate, the last a little longer than the preceding. Abdomen with seven segments, and a forceps, the arms of which are thick, two-jointed ; the second joint not unguiculate, but slightly toothed. *Fem.* *Antennæ* shorter, *ten-jointed* ; third and tenth joints elongate-oval ; fourth and following joints oval.

1. **latipes**, Hal. E. M. i. 156 (1833) ; Winn. *Mas et Fœm.* Ni-gra, antennis pallide fusco-flavis, basi nigris, thorace nitido, alis hyalinis, halteribus fuscis, abdomine sordide fuseo-flavo, incisuris nigricantibus, pedibus pallide fusco-flavis ; *Fœm.* tarsorum artieulis tertio, quarto, et quinto dilatatis. Long. 1 ; alar. 2 lin.

*Male and Fem.* Black, pubescent. *Antennæ* pale brownish-yellow, black at the base. Thorax shining. Wings limpid. Halteres brown. Abdomen dingy, brownish-yellow ; sutures black. Legs pale brownish-yellow. *Fem.* Third, fourth, and fifth joints of the tarsi dilated. In the recent insect the body is bluish-black, a little rufescens under the wings.

Rare. In the collection of Mr. Haliday. (I.)

2. **brevinervis** ? Zett. D. S. x. 3770. 3 (1851). Obscure rufescens, antennis nigricantibus thorace brevioribus, abdomine pallide rufo, pedibus pallidis. Long.  $\frac{3}{4}$  ; alar.  $1\frac{1}{2}$  lin.

Dusky reddish. Abdomen brighter. *Antennæ* blackish, shorter than the thorax. Legs pale.

Mr. Haliday has forwarded to me this description of a specimen (since lost), which he supposes to be identical with the above species. Cork. (I.)

### Genus XVIII. ANARETE.

ANARETE, Hal. E. M. i. 156 (1853). *Lestremia* p., Meig. *Sciara* p., Zett.

Oculi emarginati. *Ocelli tres.* *Antennæ breves, 9-articulatæ, articulis duobus baseos majoribus.* Alæ incubentes, nudæ ; vena costæ mediæ inserta. *Tibiæ ecalcaratæ.*

Eyes emarginate. *Ocelli three.* *Antennæ short, with nine joints ;* first and second joints thicker than the following. Wings incumbent, bare ; subcostal vein half the length of the wing ; *cubital and subanalis simple.* *Tibiæ without spurs.*

1. **candidata**, Hal. E. M. i. 156 (1833).—*albipennis*, Meig.—*coracina*, Zett. Atra, alis niveis, pedibus pallidis, tibiis tarsisque posticis albis. Long. 1 ; alar. 2 lin.

Glossy black, nearly as large as *Lestremia leucophæa*, from which it differs principally by the antennæ; the wings are alike in neurulation. Wings pure white; veins colourless, except the two subcostal, which are rosy in newly-disclosed specimens.- Legs pale, much longer in the male than in the female; hind tibiæ and tarsi white.

Rare. (E. I.)

---

### Genus XIX. CAMPYLOMYZA.

CAMPYLOMYZA, Wied.; Meig. Z. i. 101 (1818); Mcq.; Westw.; Stæg. *Cecidomyia* p., Meig. Kl. Z. *Campylomyia*, Zett. *Porri-condyla*? Rondani.

Corpus oblongum, parvum aut minimum, plerumque nigrum. Caput parvum. Oculi remoti. *Ocelli tres*. Proboscis brevis, arcuata. Palpi parvi, porrecti, arcuati. Antennæ 11–20-articulatæ, moniliformes, porrectæ. Thorax ovatus. Alæ mediocriter longæ, sat latæ; vena costalis cum cubitali ad alæ apicem terminata; medias-tinalis obsoleta; subcostalis alæ dimidio paullo brevior; venula obliqua transversa subcostalem et cubitalem connectens; vena subapicalis fere obsoleta; subanalis distincta, analis angulata aut subobso-lcta furcata. Halteres parvi. Abdomen segmentis 8. Pedes sat graciles, non elongati; metatarsus elongatus. *Mas.* Antennæ moniliformes, corporis longitudine; articuli globosi, remoti, pilosi. Abdomen lineare. *Fœm.* Antennæ submoniliformes, corpore multo breviores; articuli approximati, pubescentes. Abdomen lanceola-tum, valvulis duabus apicalibus.

Body oblong, small, or very minute, generally black. Head small, sessile. Eyes remote. *Ocelli three*. Proboscis curved. Palpi small, porrect, curved. Antennæ eleven- to twenty-jointed, moniliform, porrect. Thorace oval. Wings moderately long, rather broad; cubital vein ending at the tip of the wing; mediastinal obsolete; subcostal less than half the length of the wing, connected near its tip with the cubital by an oblique transverse veinlet; cubital nearly straight, ending at the tip of the costal; subapical almost obsolete; subanal distinct, nearly straight; anal forming with its second branch a slightly obtuse angle, its first branch nearly obsolete, contiguous to the anal vein. Halteres rather short. Abdomen with eight segments. Legs of moderate length and thickness; joints of the tarsi from the first to the fourth successively decreasing in length. *Male.* Antennæ moniliform, as long as the body; joints globose, remote, pilose. Abdomen linear. *Fem.* Antennæ submoniliform, much shorter than the body; joints approximate, pubescent. Abdomen launceolate, with two apical valves.

The *Campylomyzæ* abound in hedges and woods, and are not uncommon on windows. In their habits they are allied to the *Sciaræ*, as well as to the *Cecidomyiæ*.

*hyalinis*, abdomine nigro-fusco, incisuris apiceque flavis, tarsis fusca. Long. 2; alar. 4 lin.

Yellow. Antennæ brown, yellow at the base; as long as the thorax. Thorax with three brown stripes, the lateral pair shortened in front. *Wings greyish, with two hyaline bands.* Abdomen blackish-brown; sutures and tip yellow. Tarsi brown.

Rare. "Inhabits decaying stumps bearing *Boleti* in copses." —Meig. In the collection of Mr. Clifton. (E.)

2. **ferruginea**, Walk. C. D. B. M. i. 88 (1848). *Fulva, antennis abdominisque fasciis fuscis, alis subcinereis, pedibus testaceis.* Long. 4; alar. 7 lin.

*Pale tawny.* Antennæ brown, testaceous towards the base. Wings slightly greyish. Abdomen with a broad brown band on the hind border of each segment. Legs testaceous; femora paler than the tibiæ.

Rare. In the British Museum. (E.)

3. **vittata**, n. *Testacea, antennis, thoracis fasciis tribus, abdominis vitta dorsali tarsisque fusca, alis subcinereis.* Long. 2½; alar. 5 lin.

Testaceous. Antennæ brown, testaceous at the base. Thorax with three brown stripes, the middle one in advance of the others, broadest in front. Wings very slightly greyish. Abdomen with a brown dorsal stripe. Tarsi brown.

Rare. (E.)

---

### Genus XXI. **PLATYURA.**

PLATYURA, Meig. Zw. i. 231 (1818); Curt.; Mcq.; Zett. *Ceroplatus* p., F.; Latr. *Rhagio* p., F. *Sciara* p., F. *Asindulum* p., Latr. *Ceroplatus* p., Zett.

Corpus angustum, longum. Caput parvum. Proboscis brevis. Oculi rotundi. Ocelli tres, intermedius minimus. Palpi 4-articulati; articulus quartus longus, linearis. *Antennæ* 17-articulatæ, breves, validæ. Thorax brevis, subellipticus. *Alæ nudæ, medioeriter latae; vena cubitalis furcata.* Halteres breves. Abdomen depresso, thorace triplo longius. *Pedes graciles, longiuseuli; tibiæ non spinosæ; calcaria brevia.*

Body narrow, long. Head small. Proboscis short. Eyes round. Ocelli three, the middle one very small. Palpi four-jointed; first joint small; second robust; third large; fourth long, linear. *Antennæ short, stout, seventeen-jointed, less than half the length of the body; joints transverse.* Thorax short, nearly elliptical. *Wings bare, moderately broad; subcostal vein slightly curved forward towards its tip, ending at very little beyond one-third of the length of the wing; radial straight, ending at a little before two-thirds of the length; cubital forked, connected with the radial at before one-third of the length, when it forms*

a curve near its junetion with the præbrachial transverse, and is very slightly curved from thence to its end, which is very little in front of the tip of the wing; its fore fork is more or less oblique; subapical emerging from the cubital at half the length of the wing, forked at one-third of its length from thence to its end, its fore fork ending at very little behind the tip of the wing; subanal forked at one-third of the length of the wing, its hind fork curved hindward, and diverging much from the fore one; anal extending to the hind border; subaxillary not reaching the hind border; humeral veinlet near the base; areolets thirteen,—the humeral, the radical, the subcostal, the radial, the probrachial, which is united to the pobrachial and shortened towards the tip, the two cubital, three extero-medial, the anal, the axillary, and the sub-axillary. Posterior margin forming a slight and very acute angle at twice the length of the humeral areolet from the base. Halteres short. Abdomen somewhat depressed, about thrice longer than the thorax. Legs rather long and slender; tibiæ without spines, their spurs short. *Male.* Abdomen nearly linear and cylindrical. *Fem.* Abdomen elongate-obclavate or subfusiform.

These flies are similar to the *Mycetophilæ* in their habits; most of the species inhabit woods, and their larvæ feed on fungi. The species may be grouped thus:—

- a.* Fork of the cubital vein joining the radial. Species 1.
- a a.* Fork of the cubital vein joining the eostal.
- b.* Fork of the cubital vein rather long.
  - c.* Fork of the cubital vein curved. Species 2-4.
  - c c.* Fork of the cubital vein straight. Species 5, 6.
- b b.* Fork of the cubital vein short.
  - c.* Wings spotted. Species 7-10.
  - c c.* Wings not spotted. Species 11-14.

1. ***marginata***, Meig. Zw. i. 232. 1 (1818); Meq. Nigra, palpis pedibusqne testaceis, alis subcinereis macula disculi marginibusque obscurioribus, halteribus tibiisque fulvis, tarsis fuscis; *Fœm.* abdominis fasciis ferrugineis. Long.  $3\frac{1}{2}$ -4; alar.  $5\frac{1}{2}$ -6 lin.

Black, shining. Palpi tawny. Antennæ a little longer than the thorax. Wings greyish, clouded with grey towards the tips and along the hind border, and with a slight brownish spot at the base of the subapical vein. Halteres tawny. Abdomen long. Legs testaceous; tibiæ tawny; tarsi brown. *Fem.* Wings with the discal brownish spot almost obsolete. Fore borders of the abdominal segments ferruginous.

Not common. (E.)

2. ***atrata***, F. S. A. 16. 3 (1805); Meig.; Meq. *Nigra, alis cinereis macula antica subapicali fusca, halteribus testaceis, femoribus tibiisque obscure testaccis, illis basi nigris.* Long. 3; alar. 5 lin.

Black, shining. Antennæ stout, a little shorter than the thorax. Wings grey, with a diffused subapical brown spot in front. Halteres

13. **discoloria**, Meig. Zw. i. 239. 14 (1818); Meq.—*discolor*, Wahlb.; Zett. *Fulva*, subtus testacea, palpis, halteribus pedibusque testaceis, antennis nigris, alis subtestaceis, *abdomine fasciis fuscescentibus*. Long.  $1\frac{1}{2}$ –2; alar. 2–4 lin.

*Tawny*, testaceous beneath. Palpi testaceous. Antennæ black, rather slender, shorter than the thorax. Wings with a very slight testaceous tinge. Halteres testaceous. *Fore borders of the abdominal segments more or less brownish*. Legs testaceous; tarsi brownish.

Generally distributed. Frequent the lime-tree. (E. S. I.)

14. **concisa**, n. *Nigra*, palpis, halteribus, *abdominis fasciis pedibusque testaceis*, pectore thoracisque lateribus piceis, *alis subcinereis*, tarsis fuseescentibus. Long. 2; alar. 4 lin.

*Black*. Palpi testaceous. Antennæ testaceous at the base. Peetus and sides of the thorax piceous. *Wings greyish*. Halteres testaceous. *Hind borders of the abdominal segments testaceous*. Legs testaceous; tarsi brownish.

Rare. (E.)

---

### Genus XXII. MACROCERA.

**MACROCERA**, Meig. Zw. i. 222 (1818); Curt.; Meq.; Zett.

Corpus gracile, sublineare, longum, pubescens. Caput parvum. Oculi rotundi. Ocelli 3, intermedium parvus, ante positus. Palpi 4-articulati, breves, sublineari. Antennæ 16-articulatae, *gracillimæ*, corpore æquales aut triplo longiores. Thorax brevis, ellipticus. Alæ latiusculæ; *vena cubitalis furcata*. Halteres breves. Abdomen lineare aut sublineare, thorace triplo aut quadruplo longius. Pedes longi, graciles; tibiæ non spinosæ, calcaribus minimis. Mas. Antennæ longiores, apiee pilosæ. Fæm. Antennæ breviores.

Body slender, pubescent, nearly linear. Head small. Eyes round. Ocelli three, the middle one very small, in advance of the others. Labium forming two large pubescent lobes. Palpi four-jointed; first joints longer than the second, or than the third; fourth as long as the first. Antennæ sixteen-jointed, *very slender, as long as the body, or thrice its length*. Thorax short, elliptical. Wings moderately broad; subcostal vein slightly curved forward at its tip, ending at much before half the length of the wing; radial curved upwards at its tip, ending at a little beyond half the length; *cubital forked*, springing from the radial at before one-third of the length, near which it forms a very obtuse angle at its junction with the transverse veinlet enclosing the præbrachial and pectoral arcolets, and is slightly curved from thence to its end, which is at very little in front of the tip of the wing; its fore fork is oblique, and ends at a little beyond two-thirds of the length of the wing; subapical emerging from the cubital at before half the length, near which it is forked, and its fore fork ends at the tip of the wing;

subanal forked at one-third of the length, its hind fork curved hindward, and diverging very much from the fore one; anal extending to the hind border; subaxillary none; humeral veinlet very near the base; arcolets thirteen,—the humeral, the radical, the subcostal, the radial, the praebasital, which is united to the basital and shortened towards the tip, two cubital, three externo-medial, the subapical, the anal, and the axillary. Posterior margin forming a very slight nearly right angle, at more than three the length of the humeral arcolet from the base. Halteres short. Abdomen linear, or nearly linear, thrice or four times the length of the body. *Legs long, slender; tibiæ without spurs; their spurs very small.* *Male.* Antennæ longer than of the female, pilose at the tips. Abdomen cylindric. *Fem.* Antennæ shorter. Abdomen elongate, fusiform.

The *Macroceræ* are the most elegant of all the flies of this family of Dryads. They inhabit woods, are especially fond of the shade, and may be often found resting on palings, with their long antennæ extended. Synopsis of the species:—

- a.* Antennæ twice or threee the length of the body.
- b.* Wings unspotted.
  - c.* Thorax striped. Species 1.
  - c c.* Thorax not striped. Species 2.
- b b.* Wings spotted.
  - c.* Tips of the wings not clouded.
    - d.* Thorax not striped. Species 3.
    - d d.* Thorax striped. Species 4.
  - c c.* Tips of the wings clouded.
    - d.* Wings striped between the tip of the radial vein and the fork of the cubital vein. Species 5.
    - d d.* Wings striped before the tip of the radial vein. Species 6.
- a a.* Antennæ not longer than the body. Species 7.

1. **vittata**, Meig. Zw. vi. 293. 7 (1830); Zett.—*dorsalis*, Curt. Fulva, subitus testacea, palpis, halteribus pedibusque testaceis, antennis nigricantibus basi fulvis, thorace ferrugineo-trivittato, alis subtestaceis, abdomine vitta dorsali nigra, tarsis fuscis. Long. 3–4; alar. 6–8 lin.

Tawny, testaceous beneath. Palpi testaceous. Antennæ blackish, tawny at the base. Thorax with three ferruginous stripes, the lateral pair short. Wings with a very slight testaceous tinge. Halteres testaceous. Abdomen with a black dorsal stripe. Legs pale testaceous; tibiæ rather darker than the femora; tarsi brown.

Not rare. (E.)

2. **lutea**, Panz. Faun. Germ. ev. 7; Meig. Zw. i. 223. 1 (1818); Curt.; Meq.; Zett.; Gim.; Stæg. Testacea, antennis tarisque fuscentibus, illis basi testaceis, alis subcinereis; *Mas*, abdominis apice fuscescente. Long 2–3; alar. 4–6 lin.—Var. Abdomen fuseescens, fasciis testaceis.

Abdomen linear, nearly cylindrical. *Fem.* Antennæ nearly bare. Abdomen elongate-fusiform, with nine segments; eighth small; ninth very small, almost retracted. Tentacles exserted; their second joint smaller, ovate-orbiculate.

The *Bolitophilæ* in structure recede much from the typical *Mycetophilidæ*, and are allied to *Dixa* and *Trichocera*. The two British species frequent shady places during the greater part of the year, and appear even in the middle of winter when the weather is mild.

1. **fusca**, Meig. Zw. i. 221. 2 (1818); Mcq.; Zett.—*hybrida*, Meig. Kl.—*Saundersii*, Curt.—*maculipennis*, Walk.—*bimaculata*? Zett.; Stæg. Ferruginea, vertice thoraceque nigro-einereo, antennis nigris basi ferrugineis, thorace ferrugineo bivittato, *alis* subcinereis *macula discali cinerea et costali fusca*, halteribus apice tibiis tarsisque fuscis. Long. 4; alar. 7 lin.

Ferruginous. Vertex greyish-black. Antennæ black, ferruginous at the base. Thorax with two ferruginous stripes. Wings very slightly greyish, *with a grey spot at the tip of the præbrachial areolet, and a larger brown spot by the costa at the tip of the radial vein*. Halteres with brown tips. Tibiæ and tarsi brown.

Rare. (E.)

2. **cinerea**, Hoffm.; Meig. ! Zw. i. 221. 1. pl. 8. f. 1 (1818); Mcq.; Zett.

Nigro-cinerea, palpis, halteribus, coxis femoribusque testaceis, antennis nigris basi testaceis, pectore ferrugineo, *alis* subcinereis, *macula parva costali cinerea*, halteribus apice fuscis, tibiis tarsisque nigricantibus. Long.  $2\frac{1}{2}$ –3; alar. 4–5 lin.

Greyish-black. Palpi testaceous. Antennæ black, testaceous at the base. Pectus ferruginous. Wings very slightly greyish, *with a small grey spot by the costa at the tip of the radial vein*. Halteres testaceous with brown knobs. Legs testaceous; tibiæ and tarsi blackish.

Generally distributed. (E. S. I.)

### FAMILY III. CECIDOMYZIDÆ.

**CECIDOMYZIDÆ**, Hal. D. B. i. 7 (1851). *Tipulariæ Gallicolæ*, Meig. *Cecidomiites*, Newm. *Cecidomydes*, Mcq. *Cecidomynæ*, Rond. *Cecidomyzides*, Zett. *Lestremiæ* (olim) aut *Sciarinæ* p., Rond.

*Ocelli sæpissime nulli. Mesothoracis scutum integrum. Alarm venæ usque ad apices sex aut pauciores; vena costalis alæ apicem plerumque attingens.*

Body small or very minute. *Ocelli very generally wanting. Antennæ generally more or less verticillate, pilose, often moniliform, or with petiolated joints. Scutum of the mesonotum undivided. Wings generally*

beautifully iridescent; veins in their last subdivisions not more than six; costal vein extending nearly to the tip of the wing, or to the hind border; subapical vein almost always obsolete.

These flies are the most elegant and delicate little creatures in the whole of the *Diptera*. The species are exceedingly numerous, and generally of very minute size. Descriptions of the characters and habits of all the British species would alone fill this volume, but only a few of these have as yet been observed, and it is difficult to identify them with most of the published descriptions, and I am not able to refer to collections for specimens of them. The larvae are generally fleshy, oval grubs, rather attenuated in front, and without any exserted appendages; those of many species feed on various parts of living plants, and are thus more or less injurious to vegetation; some of them form galls, others feed on decayed wood. The pupa resembles the imago, but its form is much more contracted, with the wings and legs very short, and resting upon the breast, in distinct cases. Winnertz has published the most complete treatise on this family, and has reviewed the works of nearly all the previous authors thereon.

The genera may be grouped thus:—

Cubital vein	<table style="margin-left: 10px; border-collapse: collapse;"> <tr> <td style="padding-right: 10px;">Distinct</td><td style="border-left: 1px solid black; padding-left: 10px;">1. CECIDOMYIA.</td></tr> <tr> <td style="padding-right: 10px;">Obsolete</td><td style="border-left: 1px solid black; padding-left: 10px;">2. LASIOPTERA.</td></tr> </table>	Distinct	1. CECIDOMYIA.	Obsolete	2. LASIOPTERA.
Distinct	1. CECIDOMYIA.				
Obsolete	2. LASIOPTERA.				

The only recorded genera in addition to these are *Spaniocera* and *Heteropeza* of Winnertz, and *Brachineura* and *Ozirhynchus* of Rondanii, which have not been discovered in Britain.

### Genus I. CECIDOMYIA.

CECIDOMYIA, Latr. Gen. Cr. iv. 253 (1803); Meig.; Meq.; Loew; Winn.; Zett. *Tipula* p., L.; F. (Sp. I. et E. S.); Gmel.; D. G.; Sehr. *Chironomus* p., F. (S. A.). *Macroceria* p., Meig. Kl. *Cecidomyia* et *Lasioptera* p., F. (S. A.) *Cecidomyza*, Zett. *Oligotrophus*, Latr.

Caput parvum. Oculi lunati, apud verticem contigui. *Ocelli nulli.* Proboscis brevis, crassa. Palpi 4-articulati; articulus primus brevis; secundus et tertius plerumque aequales; quartus saepissime longior. Antennae longae, 13–36-articulatae, moniliformes aut filiformes, plerumque verticillato-pilosae. Thorax rotundatus, nonnunquam gibbosus aut antice productus. Alae amplae, saepissime ciliatae; vena costalis alae apicem plerumque attingens; subcostalis apud costae dimidium terminata; *cubitalis costali ad apicem connexa*; subapicalis saepissime nulla; subanalisis simplex, nonnunquam obsoleta; analis furcata, raro apicem versus obsoleta. Halteres magni. Abdomeu segmentis 8, plerumque lineare. Pedes saepissime longi, graciles; tibiae non spinosae nec calcaratae; metatarsus brevissimus. *Mas.* Antennae

- k k.* Wings limpid. Species 51–55.
- i i.* Wings coloured. Species 56–63.
- h h.* Joints of the antennæ of the male wholly single, and with only one whorl of hairs.
  - i.* Wings limpid, or nearly so. Species 64–71.
  - i i.* Wings greyish, or grey. Species 72–82.
- g g.* Cubital vein joining the costal behind the tip of the wing.
- h.* Whorls of hairs on the joints of the antennæ of the male equally long above and below.
  - i.* Wings unspotted.
  - j.* Body white. Species 83.
  - j j.* Body yellow, or testaceous.
    - k.* Thorax without stripes, or a dark disc.
      - l.* Wings limpid. Species 84–87.
      - l l.* Wings nearly limpid. Species 88.
      - l l l.* Wings greyish. Species 89–92.
    - k k.* Thorax with stripes, or a dark disc.
      - l.* Wings limpid. Species 93–96.
      - l l.* Wings nearly limpid. Species 97–99.
      - l l l.* Wings greyish. Species 100–103.
      - l l l l.* Wings slightly brown. Species 104.
    - j j j.* Body brownish-testaceous. Sp. 105, 106.
    - j j j j.* Body tawny. Species 107–110.
    - j j j j j.* Body brown, or black.
      - k.* Wings milk-white. Species 111.
      - k k.* Wings slightly fawn-colour. Species 112.
      - k k k.* Wings limpid. Species 113.
      - k k k h.* Wings greyish. Species 114–117.
      - k k k k k.* Wings grey. Species 118–121.
    - i i.* Wings spotted. Species 122, 123.
  - h h.* Antennæ of the male with long hairs on the upper side. Species 124–126.
  - f f.* Antennæ filiform; joints cylindrical, sessile, not verticillate-pilose. Cubital vein joining the costal behind the tip of the wing.—Subgen. *Asphondylia*, Loew; Winn. Species 127–132.
  - d d.* Thorax gibbous. Cubital vein joining the costal at the tip of the wing, or behind it.—Subgen. *Hormomyia*, Loew; Winn.
    - e.* Thorax prolonged over the head. Species 133–137.
    - e e.* Thorax not prolonged. Species 138–145.
  - c c.* Cubital vein emerging from a forked radicle, joining the costal behind the tip of the wing.—Subgen. *Colpodia*, Loew; Winn. Species 146.
  - b b.* Transverse veinlet very oblique, emerging from the base of the subcostal vein.

- c. Joints of the antennæ not or hardly petiolated. Cubital vein emerging from a flat radiele.—Subgen. *Dirhiza*, Loew.
- c c. Joints of the antennæ petiolated in both sexes, their number indeterminate. Cubital vein emerging from a forked radiele, joining the eostal behind the tip of the wing.—Subgen. *Epidosis*, Loew; Winn.
- d. Body yellow, or tawny.
  - e. Wings limpid, or nearly so. Species 147-149.
  - e e. Wings greyish. Species 150, 151.
  - e e e. Wings brownish. Species 152-157.
- d d. Body black. Species 158, 159.
- a a. Anal vein not forked. Cubital vein joining the eostal behind the tip of the wing.—Subgen. *Asynapta*, Loew; Winn.
- b. Cubital vein emerging from a forked radiele. Transverse veinlet very oblique, emerging from the base of the subeostal vein. Species 160.
- b b. Cubital vein emerging from a flat radiele. Transverse veinlet between the base and the tip of the subeostal vein. Species 161, 162.

1. **rosaria**, Loew, Pr. Pos. Gymn. 35. 23 (1850); Winn.; Hardy, Seot. Gard. iii. 45 (1854). Nigro-fusea, subtus argenteo hirta, palpis flavo-fuseis, antennis 20-24-articulatis, thoraeis lateribus apud alas earneis, alis einereis hirsutie nigro-einerea, halteribus fulvis apice fuscis, abdominis ineisuris ferrugineis, pedibus supra nigro-fuseis subtus argenteis. Long.  $1\frac{1}{2}$ -2 lin.

Thorax with two stripes of thick-set hairs, which appear yellowish in some aspects, whitish in others. Costal, subeostal, and cubital veins black, stout; cubital ending at hardly in front of the tip of the wing, more thickened in the middle than that of the other species of this subgenus; second branch of the anal vein curved obliquely and not abruptly to the hind border. *Male.* Antennæ twenty- to twenty-four-jointed, as long as the body; joints towards the base longer than their petioles; middle and apical joints as long as their petioles. *Fem.* Antennæ twenty-two to twenty-four-jointed, half the length of the body. Oviduct of moderate length.

Forms rosette-like galls on *Salix alba*, *caprea*, *aurita*, *cinerea*, and *depressa*. Noticed by Frisch (Beschr. xii. 7), and by De Geer (Ins. vi. 155. 27). (E. S.)

2. **Salicis**, Sehr. Fn. Boie. iii. 69. 2310 (1798); Loew; Winn.; Hardy, Seot. Gard. iii. 13 (1854). — *salicina*, Bouhé. Nigra, antennis nigro-fuscis 20-24-articulatis, thoraeis lateribus apud alas earneis, alis nigro-einereis, halteribus obscure fuscis, femoribus tibiisque subtus argenteis; *Fem.* abdominis ineisuris ventreque earneis. Long.  $1\frac{1}{3}$ - $1\frac{1}{2}$  lin.

Thorax with two stripes of yellowish-white glistening hairs. Body, wings, and legs very pubescent; hairs of the body and of the legs

middle of the subcostal vein; cubital somewhat curved in the middle, straight from thence to the tip, joining the costal at some distance in front of the tip of the wing; second branch of the anal vein curved to the hind border. *Male.* Antennæ fifteen- to sixteen-jointed, nearly as long as the body; joints towards the base twice the length of their petioles, but only longer by one-third towards their tips. *Fem.* Antennæ fifteen-jointed, half the length of the body. Abdomen with broad black hairy bands, oviduct elongated, without valves; first segment blackish, broad and thick; second and third yellowish.

Lives in the deformed leaf-borders of *Salix viminalis*. (E. S.)

9. **Sisymbrii**, Sehr. Fn. Boic. iii. 83. 2352 (1798); Loew; Winn. —*Barbareæ*, Curt. Nigra, facie ferruginosa, proboscide palpisque albidis, antennis nigro-fuseis, 16–17-articulatis, thoraeis lateribus halteribus abdomineque fulvis aut fuseis, alis subeinebris costa nigra, femoribus basi subtusque flavis, tibiis tarsisque albo-nitentibus. Long.  $\frac{2}{3}$ – $\frac{3}{4}$  lin.

Wings with black pubescence, and with blackish-brown veins; transverse veinlet pale, very oblique, joining the middle of the subcostal vein; cubital vein bent forward at its junction with the transverse veinlet, thence curved towards the fore border, which it joins far from the tip of the wing; second branch of the anal vein curved obliquely, and not abruptly to the hind border. *Male.* Antennæ sixteen- to seventeen-jointed, rather longer than the body; joints as long as their petioles in the middle, rather longer towards the base, and rather shorter towards the tips of the antennæ. *Fem.* Antennæ sixteen-jointed, rather more than half the length of the body; oviduct elongated, very slender, without valves; second and third segments yellowish.

Lives in May and June in the flowers of *Barbara vulgaris*, and from June to November in the folded, blister-like galls of *Nasturtium sylvestre*.

10. **salicina**, Sehr. Fn. Austr. 425. 884 (1781); Loew; Winn.; Hardy, Seot. Gard. iii. 48 (1854). —*Frischii*, Bremer. Nigro-fusca, fasciculis argenteis, facie proboscide et palpis fuseo-fulvis aut fuseis, antennis 16–17-articulatis, thoraeis lateribus fulvo-vittatis, alis eingercentibus pilis obscurioribus, halteribus albidis apice nonnunquam fuseis, abdomine earneo, fasciis dorsalibus nigris, pedibus subtus argenteis. Long.  $\frac{3}{4}$ –1 lin.

Costa of the wings squamose, stout, deep black; veins dark brown; transverse veinlet pale, situate about the middle of the subcostal vein; cubital *very slightly curved*, ending at some little distance from the tip of the wing; second branch of the anal forming an obtuse angle, slightly curved to the hind border. *Male.* Antennæ sixteen to seventeen-jointed, nearly as long as the body; joints as long as their petiole, rather longer towards the base. *Fem.* Antennæ sixteen-jointed, half the length of the body. Abdomen tawny beneath. Oviduct elongated, without valves; two last segments whitish-yellow.

Lives in the withered tips of the young shoots of *Salix Caprea* and *S. alba*. Noticed by Frischl (Beschr. i. 4. 38. xxi.).

11. **iteophila**, Loew, Pr. Pos. Gym. 35. 26 (1850); Winn. Nigro-fusca, antennis 14-15-articulatis, alis cinerascentibus, pedibus fuscis subtus pallidioribus. Long.  $\frac{2}{3}$ - $\frac{3}{4}$  lin.

Costa of the wings squamose, stout, deep black; veins dark brown; transverse veinlet pale, situate about the middle of the subcostal vein; cubital vein quite straight, ending at some little distance in front of the tip of the wing; second branch of the anal forming an obtuse angle, slightly curved to the hind border. *Male*. Antennæ 14-15-jointed, nearly as long as the body; joints as long as their petioles, rather longer towards the base. *Fem.* Antennæ fourteen-jointed, half the length of the body. Abdomen tawny beneath. Oviduct elongated, without valves; two last segments whitish-yellow.

Very nearly allied to *C. salicina*; joints of the antennæ one or two less in number. Lives in the rose-like galls of *Salix alba*.

12. **heterobia**, Loew, Pr. Pos. Gym. 35. 25 (1850); Winn. Nigro-fusca, alis cinerascentibus, pedibus fuscis subtus pallidioribus; *Mas*, antennis 17-19-articulatis; *Fæm.* antennis 16-articulatis. Long.  $\frac{3}{4}$  lin.

Costa of the wings squamose, stout, deep black; veins dark brown; transverse veinlet pale, situate about the middle of the subcostal vein; cubital vein generally quite straight, in some cases slightly curved upward near the tip, ending at some little distance in front of the tip of the wing; second branch of the anal forming an obtuse angle, slightly curved to the hind border. *Male*. Antennæ seventeen- to nineteen-jointed, nearly as long as the body; joints as long as their petioles, rather longer towards the base. *Fem.* Antennæ sixteen-jointed, half the length of the body. Abdomen tawny beneath. Oviduct elongated, without valves; two last segments whitish-yellow.

Lives in the male flowers and in the rosettes on the tips of the twigs of *Salix amygdalina*, and changes there to the pupa state.

13. **terminalis**, Loew, Pr. Pos. Gym. 35. 28 (1850); Winn. Nigro-fusca, antennis basi fuscis aut flavis, alis cinerascentibus, pedibus fuscis subtus pallidioribus; *Mas*, antennis 19-articulatis; *Fæm.* antennis 16-articulatis. Long.  $\frac{2}{3}$ -1 lin.

Antennæ often brown or yellow at the base. Costa of the wings squamose, stout, deep black; veins dark brown; transverse veinlet pale, situate about the middle of the subcostal vein; cubital vein generally distinctly curved towards the tip, ending at some little distance in front of the tip of the wing; second branch of the anal forming an obtuse angle, slightly curved to the hind border. *Male*. Antennæ nineteen-jointed, nearly as long as the body; joints as long as their petioles, rather longer towards the base. *Fem.* Antennæ sixteen-jointed, half the length of the body. Abdomen tawny beneath. Oviduct elongated, without valves; two last segments whitish-yellow.

petioles of almost equal length; last joint generally not petiolated. *Fem.* *Antennæ fifteen-jointed*, half the length of the body; joints not close set together, but hardly petiolated. Oviduct elongated, yellow towards the tip, without valves.

Generally distributed. (E.) Lives in the leaf-tufts of *Cra-tægus Oxyacanthus* and *C. coccinea*, and assumes the pupa state sometimes there, sometimes in the earth. The shoots in white-thorn hedges very often terminate in tufts or knobs, each of which is tenanted by several of the grubs of this fly.

21. **Brassicæ**, Winn. Linn. Ent. viii. 231. 18 (1853). *Nigra aut nigro-fusca, palpis albidis, antennis 15-articulatis, alis limpidis, costa nigra, basi halteribusque carneis, abdomine carneo fasciis dorsalibus nigris, pedibus subtus argenteis.* Long.  $\frac{1}{2}$ - $\frac{5}{8}$  lin.

Wings with black veins; subcostal vein very near the costa; transverse veinlet joining the middle of the subcostal vein; cubital vein convex hindward, joining the costa far from the tip of the wing; second branch of the anal vein curved to the hind border. *Halteres flesh-colour.* *Male.* Antennæ rather shorter than the body; joints and their petioles of equal length, with long whorls of hairs. *Fem.* Antennæ with short whorls of hairs, not quite half the length of the body; joints cylindrical, without petioles. Oviduct elongated, yellowish-white, without valves.

Lives in the pods of the rape, often from fifty to sixty in one pod, and goes into the earth previous to its metamorphose.

22. **Strobi**, Kaltenbach, MSS.; Winn. Linn. Ent. viii. 234. 20 (1853). *Fusca, antennis 17-19-articulatis, alis limpidis cinerco-hirtis, costa nigro-fusca, halteribus albis, ventre argenteo, pedibus piceis subtus albo-micantibus.* Long.  $1-1\frac{1}{10}$  lin.

Wings with pale brown veins; transverse veinlet slender and pale, joining the subcostal at two-thirds of its length; cubital vein a little bent forward at its junction with the veinlet, thence slightly curved hindward, and joining the costal near the tip of the wing; second branch of the anal vein curved towards the hind border. *Male.* *Antennæ nineteen-jointed*, as long as the body; middle and apical joints and their petioles of equal length. *Fem.* *Antennæ seventeen to eighteen-jointed*, half the length of the body; joints without petioles, but not close-set together. Oviduct elongated, without valves; second and third joints yellowish-white.

Lives in the fallen cones of *Pinus Abies*.

23. **serotina**, Winn. Linn. Ent. viii. 316. 97 (1853). *Nigro-fusca, capite palpis antennisque fuscis, his 16-17-articulatis, alis limpidis pilis costaque nigris, halteribus niveis, abdomine fasciis pilosis nigris, pedibus subtus albo-nitentibus; Mas, abdomine nonnunquam fulvo; Fem. abdomine carneo.* Long.  $\frac{2}{3}$ - $\frac{3}{4}$  lin.

Subcostal vein near the costa; transverse veinlet very pale, joining

the middle of the subcostal vein ; cubital vein convex behind, joining the costa at some distance from the tip of the wing ; second branch of the anal vein curved towards the hind border. *Male.* Antennæ sixteen to seventeen-jointed ; as long as the body ; joints as long as their petioles. Abdomen occasionally tawny ; hind borders of the segments with black hairs. *Fem.* Antennæ sixteen-jointed, as long as the head and the thorax together. Abdomen flesh-colour ; hind borders of the segments with black hairs. Oviduct elongated, whitish, without valves.

Lives in the tips of the shoots of *Hypericum humifusum*, and changes to a pupa in the earth.

24. **circumdata**, Winn. Linn. Ent. viii. 226. 14 (1853). Fusca, capite flavo, antennis fuscis 13–14-articulatis basi flavis, thoracis lateribus scutello pectore et metathorax flavis, alis ovatis subfuscescensibus nigro-hirtis, halteribus albidis apice nigro-fuseis, abdominis incisuris basi ventreque flavis, abdomine sordide flavo incisuris albidis, pedibus nigro-fuscis subtus pallidis. Long.  $\frac{1}{2}$  lin.

Veins of the wings blackish-brown ; transverse veinlet very pale and small, joining the middle of the subcostal vein ; cubital vein much bent forward at its junction with the veinlet, beyond which it is slightly curved forward, and ends at hardly in front of the tip of the wing ; second branch of the anal vein forming an obtuse angle, and joining the hind border. *Male.* Antennæ fourteen-jointed, as long as the body ; joints twice the length of their petioles. *Fem.* Antennæ thirteen-jointed, half the length of the body. Oviduct very short, with two small, rounded, whitish valves.

Lives in the leaf-tops or tufts of *Crataegus Oxyacantha*, and changes to the pupa state in the earth.

25. **Betulæ**, Kalt. MSS. ; Winn. Linn. Ent. viii. 234. 21 (1853). *Obscure citrina, antennis fuscis 12–13-articulatis, thoracis dorso nigro-fusco, alis limpidis aut lacteis, pilis venisque pallidis, halteribus albis, abdome nonnunquam fuscescente, pedibus pallide flavis.* Long.  $\frac{9}{10}$ – $1\frac{1}{10}$  lin.

*Wings limpid or whitish* ; transverse veinlet filiform, colourless, situate at a little before the middle of the subcostal vein ; cubital vein almost straight, but slightly curved hindward towards the tip, which joins the costa near the tip of the wing ; second branch of the anal vein curved towards the hind border. *Male.* Antennæ twelve- to thirteen-jointed, rather more than half the length of the body ; joints longer by half than their petioles ; apical joint with a very short petiole. *Fem.* Antennæ twelve-jointed, one-third of the length of the body ; joints sessile. Oviduct moderately long, without valves ; third segment white.

Appears in March, April, or May, having lived through the winter in the preceding year's female catkins of *Betula alba*.

26. **Galeobdolontis**, Kaltenbach, MSS. ; Winn. Linn. Ent. viii. 238. 25 (1853). *Fœm. pallide flava, antennis fuscis 16-articulatis,*

*Fem.* *Pale testaceous.* Head and antennæ blackish. *Wings slightly greyish*; veins brown. *Legs whitish testaceous*, slender; *tarsi brownish*. Not common. (E.)

34. **tecta**, n. *Fœm. testacea*, capite antennisque nigris, his corpore multo brevioribus, articulis cylindricis, *alis latis cinereis*, venis nigris, *abdomine piceo*, pedibus validis. Long. 1; alar. 2 lin.

*Fem. Testaceous.* Head and antennæ black. Antennæ eleven-jointed, verticillate-pilose, testaceous at the base, much shorter than the body; joints double, nearly cylindrical, about twice the length of their petioles. *Wings broad, grey*, pubescent, ciliated all round the border; veins black; subcostal vein little more than one-third of the length of the wing; cubital hardly curved; subanal very distinct; first branch of the anal slight, apparently united with the subanal; second branch curved very abruptly and hardly obliquely to the hind border. *Abdomen piceous.* Legs stout, pubescent, not long.

Rare. (E.)

35. **Ulmariæ**, Bremi, Denskschr. Sehw. Ges. Naturw. 52. 9 (1847); Hardy; Loew; Winn. *Fusco-flava*, capite flavo, vertice nigricante, antennis fuscis 16-articulatis basi flavis, *thorace vittis tribus nigro-fuscis*, *alis subfusciscentibus*, venis pilis marginaque nigricantibus, halteribus flavescentibus capitulo fusco, abdomine rufo-flavo fasciis nigro-pilosis, pedibus nigro-fuscis subtus albicantibus. Long.  $\frac{1}{3}$ - $\frac{2}{3}$ ; alar.  $\frac{3}{4}$ - $1\frac{1}{4}$  lin.

*Brownish-yellow.* Head yellow; vertex blackish. Antennæ brown, with sixteen joints, yellow at the base. *Thorax with three blackish-brown stripes.* *Wings slightly brown*, with the veins, hairs, and borders blackish; transverse veinlet very pale, indistinct, joining the middle of the subcostal vein; cubital vein somewhat bent forward at its junction with the veinlet, slightly convex in front nearer its tip, joining the costa far from the tip of the wing; second branch of the anal vein curved to the hind border. Halteres yellowish, with brown knobs. Abdomen tawny, with bands of black hairs. Legs blackish-brown, whitish beneath. *Male.* Antennæ as long as the body; joints as long as their petioles, rather longer towards the base. *Fem.* Antennæ half the length of the body; joints with very short but distinct petioles. Oviduct whitish-yellow, elongated, without valves; first segment tawny.

Lives in wart-like galls on the leaves of *Spiraea Ulmaria*. The fly appears in the middle of August. (E. S.)

36. **basalis**, n. *Fœm. ferruginea*, capite nigro, antennis testaceis apice fusciscentibus, *alis subfusciscentibus*, halteribus pedibusque pallide testaccis, abdomine testaceo basi nigro. Long.  $\frac{1}{2}$ ; alar. 1 lin.

*Fem. Ferruginous.* Head black. Antennæ testaceous, submonili-form, brownish towards the tips; joints slightly petiolated. *Wings very slightly brownish*; veins pale. Halteres pale testaceous. Abdomen testaceous, black towards the base. Legs pale testaceous.

Not common. (E.)

37. **bursaria**, Brems, Denkschr. Schw. Ges. Naturw. 51. 10 (1847); Winn. *Fem. flava*, vertice thoracisque vittis nigris, antennis fuscis 18-articulatis basi flavis, *alis subcinereis* margine (costali præsertim) nigro, halteribus fuscis basi flavis, abdomine c pilis nigris fasciato, pedibus nigro-fuscis subtus flavis. Long. 1 lin.

*Yellow.* Antennæ brown; joints about four times the length of their petioles. Thorax with three contiguous shining black stripes. *Wings greyish*, with blackish-grey pubescence; veins dark brown; transverse veinlet very slender and pale, joining the middle of the subcostal vein; cubital vein at first straight, afterwards convex forwards, joining the costa at a moderate distance from the tip of the wing; second branch of the anal vein slightly curved between its base and the hind border. Oviduct elongated, yellow, without valves.

Lives in the pyramidal hairy galls on the upper sides of the leaves of *Glechoma hederacea*.

38. **Urticæ**, Perris, Ann. Soc. Ent. Fr. ix. 401 (1840); Loew; Winn. *Fulva*, capite flavo, antennis fuscis 16–18-articulatis basi flavis, thorace vittis tribus nigro-fuscis, *alis fere limpidis* margine (costali præsertim) nigro, halteribus fuscis basi flavis, abdomine sordide flavo e pilis nigris fasciato, pedibus nigris, femoribus basi coxisque flavis. Long.  $\frac{2}{3}$ – $\frac{3}{4}$  lin.

*Tawny.* Head yellow. Antennæ brown, yellow at the base. *Thorax with three blackish-brown stripes.* *Wings almost limpid*; the borders (especially the costal) black; veins brown; transverse veinlet slight, very pale, joining the middle of the subcostal vein; cubital vein bent upward at its junction with the veinlet, joining the costa far from the tip of the wing; second branch of the anal vein joining the hind border, and forming an obtuse angle. Halteres brown, yellow at the base. Abdomen dingy yellow, with borders of black hairs. Legs black; femora at the base and coxae yellow.

Lives from June to October in the galls on the leaves and leaf-stalks of *Urtica dioica*; changes to a pupa in the earth.

39. **Pyri**, Bouché; Loew; Winn. Linn. Ent. viii. 242. 29 (1853). *Nigro-fusca*, palpis fusco-flavis, antennis fuscis 15–16-articulatis, *alis limpidis*, pilis nigro-cinereis, costa nigra, halteribus fuscis, abdomine carneo fusco-fasciato, pedibus piceis subtus albo-nitentibus. Long.  $\frac{1}{2}$ –1 lin.

*Blackish-brown.* *Wings limpid*; subcostal and cubital veins black; transverse veinlet large, rather pale, but distinct, joining the middle of the subcostal vein; cubital vein slightly curved in the middle, straight from thence to the tip, which joins the costa at some distance from the tip of the wing; second branch of the anal vein curved to the hind border. *Male.* Antennæ most generally sixteen-jointed, as long as the body; joints and their petioles of equal length. *Fem.* Antennæ most generally fifteen-jointed, rather more than one-third of the length of the

pale in some cases, brown in others, at a little beyond the middle of the subcostal vein; second branch of the anal vein forming a rounded angle. *Male.* Antennæ twenty-six-jointed; joints rather shorter than their petioles. *Fem.* Joints of the antennæ rather longer than their petioles. Oviduct very short, with two little somewhat rounded valves.

Habits unknown.

46. ***mutabilis***, Winn. Linn. Ent. viii. 248. 34 (1853). *Fæm.* *fusca*, capite palpis humeris et pectoris lateribus flavis, antennis corporis longitudine, thorace nigro-trivittato, pectore nigricante, alis subfuscescens-tibus, venis fuscis, halteribus abdomineque fulvis, hoc basi nigrieante, oviductu brevi lamellis duabus rotundatis, femoribus nigris subtus albo-flavis. Long.  $\frac{2}{3}$  lin.

*Fem. Brown.* Head, palpi, shoulders, and sides of the pectus yellow. Antennæ as long as the body, yellow at the base; joints longer by half than their petioles. Thorax with three black stripes. Pectus blackish. Wings slightly brownish, with blackish-grey pubescence; transverse veinlet at a little beyond the subcostal vein; anal vein and its second branch forming an obtuse angle. Halteres tawny. Abdomen tawny, with grey hairs; first, second, and third segments occasionally blackish. Oviduct short, with two rounded valves.

Habits unknown.

47. ***sylvatica***, Winn. Linn. Ent. viii. 249. 35 (1853). *Fæm.* *nigra*, capite thoracis lateribus abdomineque fulvis, hoc fasciis nigris, palpis halteribusque pallidis, thorace e pilis flavescentibus bivittato, alis limpidis, venis fuscis, oviductu corporis longitudine lamellis nullis, pedibus fuseis. Long.  $\frac{3}{5}$  lin.

*Fem. Black.* Head, sides of the thorax, and abdomen tawny. Palpi pale. Antennæ blackish-brown, half the length of the body; joints about five times the length of their petioles. Thorax with two stripes of yellowish hairs. Wings limpid, deeply ciliated; veins brown; transverse veinlet joining the middle of the subcostal vein; second branch of the anal vein curved to the hind border. Halteres pale. Abdomen with black bands. Oviduct as long as the body, without valves. Legs brown.

Habits unknown.

48. ***Polypori***, Winn. Linn. Ent. viii. 249. 36 (1853). Flavofusca, capite proboscide palpisque flavo-albis, antennis fuscis basi albis, thoracis lateribus pectore halteribusque fulvis, alis subcinereis, abdomine rufo, femoribus fulvis, tibiis flavis, tarsis fuseis; *Mas.* antennis corpore duplo longioribus, alis subcinereis; *Fæm.* antennis corpore vix longioribus, oviductu brevi lamellis duabus parvis flavescentibus, alis subflavescentibus. Long.  $\frac{3}{5}$  lin.

Wings with black pubescence; veins blackish, or dark brown; transverse veinlet joining the middle of the subcostal vein; anal vein and its second branch forming an obtuse angle. *Male.* Antennæ twice

the length of the body; double joints as long as the petioles. *Fem.* Antennæ rather longer than the body; petioles one-fourth shorter than the joints. Oviduct short, with two small yellowish valves.

Lives in most species of *Polyporus*.

49. **socialis**, Winn. Linn. Ent. viii. 251. 38 (1853). *Fem. flava*, antennis pallide fuscis, *thorace vittis tribus fuscis*, alis subcincereis, venis pallide fuscis, oviductu brevissimo lamellis duabus rotundatis. Long.  $\frac{2}{3}$  lin.

*Fem.* Yellow. Antennæ pale brown, as long as the body; *joints and their petioles of equal length*. *Thorax with three brown stripes*. Wings greyish, with grey pubescence; veins pale brown; transverse veinlet joining the middle of the subcostal vein; cubital vein ending at almost in front of the tip of the wing; second branch of the anal vein curved to the hind border. Oviduct very short, with two rounded valves.

Lives in the woody excrescences on the branches of most species of *Rubus*, with the larvæ of *Lasioptera Rubi*.

50. **brevis**, n. *Mas*, testacea, brevis, capite nigro, antennis validis, *articulorum petiolis brevissimis*, *thoracis disco fuscescente*, alis subcincereis, halteribus albidis, pedibus validis testaceis. Long.  $\frac{3}{4}$ ; alar. 2 lin.

*Male.* Testaceous, short. Head black. *Antennæ* twelve-jointed, stout, submoniliform, verticillate-pilose; *joints* double, elongate, subcylindrical, with extremely short petioles. *Disc of the thorax brownish*. Wings hardly greyish, ciliated; veins pale testaceous; subcostal much less than half the length of the wing; cubital almost straight; subanal not apparent beyond the fork of the anal; first branch of the anal distinct, slightly curved; second branch curved obliquely and rather abruptly to the border. Halteres whitish. Legs pale testaceous, rather short and stout.

Rare. (E.)

51. **minuta**, Winn. Linn. Ent. viii. 250. 37 (1853). *Mas*, rufescente-flava, antennis fuscis corpore duplo longioribus basi flavis, *thorace vittis tribus fuscis*, pectore nigricante, alis limpidis, venis fuscis, halteribus albis, *pedibus fuscis subtus pallidis*. Long.  $\frac{1}{3}$  lin.

*Male.* Reddish-yellow, with hoary hairs. Antennæ brown, yellow at the base, twice the length of the body. *Thorax with three almost contiguous brown stripes*. Pectus blackish. Wings limpid, with blackish-grey pubescence; veins slender, brown; transverse veinlet beyond the middle of the subcostal vein; cubital vein straight, slightly curved hindward near the tip, ending at almost in front of the tip of the wing. Halteres white. *Legs brownish, pale beneath*.

Habits unknown.

52. **geniculata**, Winn. Linn. Ent. viii. 251. 39 (1853). *Mas*, flava, antennis fuscis corpore fere duplo longioribus, *thorace fusco-trivittato*, alis limpidis, venis fuscis, abdomine flavo-fusco incisuris albidis,

59. **arcuata**, Winn. Linn. Ent. viii. 256. 46 (1853). *Fusca, antennis basi flavis, scutello flavo, metathorace nigro, alis limpidis cinereo subvariis, maculis duabus arcuatis violaceo-fuscis, halteribus albis, abdomine fulvo incisuris albis, tarsis nigro-fuscis; Mas, antennis corpore longioribus; Fœm. antennis corporis longitudine, oviductu brevi lamellis duabus longi-ovatis. Long.  $\frac{1}{2}$ - $\frac{2}{3}$  lin.*

*Brown. Wings limpid, slightly clouded with grey, and with two curved violet-brown spots; veins brown; transverse veinlet at a little beyond the middle of the subcostal vein. Male. Antennæ twenty-six jointed, one-third longer than the body; double joints as long as their petioles; single joints a little shorter. Fem. Antennæ as long as the body; joints a little longer than their petioles. Oviduct short, with two elongated oval valves.*

Lives in the pulp of most Syngenesious plants; the fly has been reared from decayed wood and fungi.

60. **maculata**, Winn. Linn. Ent. viii. 258. 47 (1853). *Fœm. carnea, palpis, antennis pedibusque albidis, antennis 14-articulatis corpore paullo brevioribus, thorace fuscescente, alis limpidis maculis septem violaceo-fuscis, oviductu brevissimo lamellis duabus longiusculis. Long.  $\frac{3}{4}$  lin.*

*Fem. Flesh-colour. Palpi and antennæ whitish, fourteen-jointed, a little shorter than the body; joints and their petioles of about equal length. Thorax brownish. Wings limpid, with seven violet-brown spots; transverse veinlet at a little beyond half the length of the subcostal vein; second branch of the anal vein curved to the hind border. Oviduct very short, with two rather long valves. Legs whitish; tarsi above and tips of the tibiæ brown.*

Habits unknown.

61. **nubeculosa**, n. *Mas, albido-cinerea, capite antennisque nigris, thoracis disco fusco, alis subcinereis fusco subnebulosis, venis nigris, halteribus albidis, pedibus pallide testaceis fuseo-subfasciatis. Long.  $\frac{3}{4}$ ; alar. 2 lin.*

*Male. Whitish-cinereous. Head and antennæ black. Antennæ twenty-two-jointed, moniliform, thickly verticillate-pilose, full as long as the body; joints alternately larger and smaller, with extremely short petioles. Disc of the thorax brown. Wings pale greyish, slightly mottled with pale brown; veins black; subcostal vein much less than half the length of the wing; cubital very slightly curved; subanal distinct, almost straight; first branch of the anal slight, running very near to the subanal; second branch curved very abruptly and hardly obliquely to the hind border. Halteres whitish. Legs pale testaceous, slender, not long, with a few light brownish bands.*

Not common. (E.)

62. **plagiata**, n. *Mas, pallide testacea, capite nigro, antennis nigricantibus basi pallide testaceis corpore vix brevioribus, alis subtes-*

*taceis cinereo-nebulosis*, pedibus mediocriter longis, fasciis latis pallide fuscis. Long.  $\frac{2}{3}$ ; alar.  $1\frac{1}{2}$  lin.

*Male. Pale testaceous.* Head black. Antennæ blackish, pale testaceous at the base, moniliform, verticillate-pilose, nearly as long as the body; joints simple, nearly oval, rather longer than their petioles. *Wings with a slight testaceous tinge, mottled with grey;* veins testaceous; subcostal vein a little less than half the length of the wing; cubital straight; subanal indistinct; first branch of the anal slight; second branch curved obliquely but abruptly to the hind border. Legs slender, moderately long, with broad, pale brown bands.

Not common. (E.)

63. **decora**, n. *Mas, albida*, capite nigro, antennis nigricantibus basi albis, alis atvis fusco-bifasciatis, venis halteribus pedibusque albis. Long.  $\frac{1}{2}$ ; alar.  $1\frac{1}{2}$  lin.

*Male. Whitish.* Head black. Antennæ blackish, white at the base, twelve-jointed ?, moniliform, verticillate-pilose, not shorter than the body; joints simple, nearly oval, longer than their petioles. *Wings white, with two brown bands, which are paler towards the hind border;* veins and halteres white. Legs white, slender, moderately long.

Rare. Found near Chepstow, Monmouthshire. (E.)

64. **Loti**, Deg. Ins. vi. 157. 29. Pl. 27 (1778); Meig.; Mcq.; Bremi; Loew; Winn. *Nigro-fusca*, antennis fuseis, thoraec e pilis albo-flavis bivittato, scutello albo-flavo, alis limpidis, halteribus albidis, ventre sordide flavo fusco-notato, pedibus piceis subtus albidis; *Mas*, antennis corpore paullo longioribus; *Fœm.* antennis corpore brevioribus, oviductu corpore longiore basi nigro nitido, lamellis nullis. Long.  $\frac{1}{2}-\frac{3}{4}$  lin.

Wings with dark grey pubescence; veins brown; transverse veinlet at a little before the middle of the subcostal vein; second branch of the anal vein curved to the hind border. *Male.* Antennæ a little longer than the body; joints mostly cylindrical, as long as their petioles. *Fœm.* Antennæ two-thirds of the length of the body; third joint longer by half than the fourth; joints about six times the length of their petioles. Oviduct black, shining, longer than the body; third segment yellow, without valves.

Lives in the blossoms of *Lotus corniculatus* and of *Medicago sativa*; generally changes to a pupa in the earth.

65. **Linariæ**, Kaltenbach, MSS.; Winn. Linn. Ent. viii. 260. 49 (1853). *Flava*, antennis fuscescente-flavis, thoracis disco fuscescente aut vittis tribus fuscis, alis limpidis, venis flavis, halteribus albis, abdome sordide fusco-flavo, pedibus fuscescentibus subtus albo-flavidis; *Mas*, antennis 26-articulatis, corpore multo longioribus; *Fœm.* antennis 14-articulatis, corpore paullo brevioribus, oviductu producto lamellis nullis. Long.  $\frac{1}{2}-\frac{3}{4}$  lin.

*Yellow. Disc of the thorax brown.* Wings with whitish pubescence;

*ticulatis* fuseeentibus basi testaceis eorporis dimidio non longioribus, *thoracis disco fusco, alis subcinereis*, venis fusceseentibus, halteribus pedibusque albidis. Long. 1; alar. 2 lin.

*Male. Testaceous.* Head black. *Antennæ* brownish, testaceous at the base, *twelve-jointed*, moniliform, verticillate-pilose, about half the length of the body; joints short, elliptical, a little longer than their petioles, which are testaceous. *Disc of the thorax brown.* *Wings slightly greyish*; veins brownish; subcostal vein less than half the length of the wing; cubital almost straight; subanal obsolete; first branch of the anal distinct; second branch curved obliquely and not abruptly to the hind border. Halteres and *legs whitish*, the latter slender, not long.

Not common. (E.)

73. **Rumicis**, Loew, Pr. Pos. Gym. 34. 48 (1850); Winn. *Flavofusca*, antennis fuseis, *thoracis dorso cinereo-fusco, alis subcinereis*, venis halteribusque fuscis, pedibus fuseis subtus flaveseentibus; *Mas*, antennis 26-articulatis eorpore fere duplo longioribus; *Fœm.* antennis eorpore paullo brevioribus, 14-articulatis, oviduetu attenuato lamellis nullis, segmentis primo et secundo albidis. Long.  $\frac{1}{2}-\frac{3}{4}$  lin.

*Yellowish-brown.* *Thorax above cinereous-brown.* *Wings greyish*, with grey pubescence; transverse veinlet beyond the middle of the subcostal vein; cubital somewhat convex behind towards the tip of the wing; second branch of the anal vein curved towards the hind border. *Male.* Antennæ 26-jointed, almost twice the length of the body; joints towards the base rather shorter than the petioles, and towards the tips little more than half their length. *Fœm.* Antennæ fourteen-jointed, as long as three-fourths of the body; joints mostly three or four times the length of their petioles. Oviduct elongated, without valves; second and third segments whitish.

Lives in the blossoms of most species of *Rumex*.

74. **albipes**, n. *Mas, fusca, antennis nigris corpore paullo longioribus, articulorum petiolis brevissimis, alis subcinerascentibus*, halteribus pedibusque albidis. Long.  $\frac{3}{4}$ ; alar. 2 lin.

*Male. Brown.* Antennæ black, twenty-jointed, moniliform, thickly verticillate-pilose, a little longer than the body; joints a little longer than broad, with extremely short petioles. *Wings very slightly greyish*; veins black; subcostal vein rather less than half the length of the wing; cubital very slightly curved; subanal almost obsolete; first branch of the anal distinct, nearly straight; second branch curved abruptly and slightly obliquely to the hind border. Halteres and legs whitish; the latter slender, of moderate length.

Not common. (E.)

75. **terminalis**, n. *Mas, fusca, capite antenisque nigris, his corpore paullo longioribus, articulorum petiolis longis testaceis, scutello albido, alis subcinereis*, halteribus pedibusque albidis. Long.  $1\frac{1}{2}$ ; alar. 4 lin.

*Male. Brown.* Head and antennæ black. Antennæ eighteen-jointed, moniliform, verticillate-pilose, a little longer than the body; joints short, elliptical, very little longer than their petioles, which are pale testaceous. *Scutellum whitish.* *Wings slightly greyish,* hardly ciliated; veins blackish; subcostal vein ending at nearly half the length of the wing; cubital straight; subanal slight, obsolete from a little beyond the fork of the anal to the tip of the wing; first branch of the anal distinct, nearly straight; second branch straight, inclined very abruptly and hardly obliquely to the hind border, forming an almost right angle. Halteres whitish. Legs whitish, long, slender.

Not common. (E.)

76. **incompleta**, n. *Mas, cinerea, gracillima, capite antennisque nigris, his corpore brevioribus, articulorum petiolis sat longis, alis sub-cinereis, halteribus nigris.* Long. 1; alar. 3 lin.

*Male. Cinereous,* very slender. Head and antennæ black. Antennæ twelve-jointed?, moniliform, verticillate-pilose, shorter than the body; joints simple, nearly oval, rather longer than their petioles. *Wings greyish;* veins black; subcostal vein rather less than half the length of the wing; cubital straight; subanal distinct from the base to some distance beyond the fork of the anal; first branch of the anal very slight, rather indistinct; second branch curved very abruptly and hardly obliquely to the border. Halteres black. Legs slender, rather long.

Not common. (E.)

77. **expandens**, n. *Mas, nigro-cinerea, antennis corpore paullo brevioribus, thoracis lateribus canis, alis cinereis, venis nigris, halteribus pedibusque cinereis.* Long. 1½; alar. 3½ lin.

*Male. Greyish-black.* Antennæ black, twenty-jointed?, moniliform, verticillate-pilose, rather shorter than the body; joints elliptical, full twice the length of their petioles. *Thorax hoary on each side.* *Wings grey,* pubescent, ciliated; veins black; subcostal vein much less than half the length of the wing; cubital very slightly curved; subanal distinct; first branch of the anal very slight; second branch curved obliquely and rather abruptly to the hind border. Halteres and legs cinereous.

Not common. (E.)

78. **semiopaca**, n. *Mas, fusca, capite antenuisque nigris corporis longitudine, thoracis lateribus albidis, alis cinereis subnebulosis, halteribus albis, pedibus albidis.* Long. 1; alar. 3 lin.

*Male. Brown.* Head and antennæ black. Antennæ fourteen-jointed?, verticillate-pilose, submoniliform, as long as the body; joints subelliptical, full twice the length of their petioles. *Sides of the thorax whitish.* *Wings grey,* pubescent, *very indistinctly mottled,* not ciliated; veins blackish; subcostal vein nearly half the length of the wing; cubital almost straight; subanal distinct, straight; first branch of the anal very slight, running very near the subanal; second branch curved very

body; double joints as long as their petioles, rather shorter towards the tips. Wings limpid, with grey pubescence; veins pale brown; transverse veinlet at before the middle of the subcostal vein; second branch of the anal curved very abruptly to the hind border.

Habits unknown.

87. **modesta**, Winn. Linn. Ent. viii. 262. 52 (1853). *Mas, pallide flava, albido-hirta, antennis corpore duplo longioribus, artieulis longe petiolatis, alis maximis limpidis cinereo-hirtis, venis fuseis, halteribus albis.* Long.  $\frac{1}{2}$  lin.

*Pale yellow, with whitish hairs. Antennæ nearly twice the length of the body;* double joints as long as their petioles, rather longer towards the base of the antennæ, rather shorter towards the tips. Wings very broad, limpid, with grey pubescence and with brown veins; transverse veinlet joining the middle of the subcostal vein; anal vein and its second branch forming a rounded obtuse angle.

Habits unknown.

88. **disjuncta**, n. *Mas, pallide testacea, antennis 12-articulatis nigris corpore paullo longioribus, alis sublimpidis, venis nigricantibus, halteribus pedibusque albidis, alis sublimpidis.* Long. 1; alar. 3 lin.

*Male.* Pale testaceous, slender. Antennæ black, twelve-jointed, moniliform, verticillate-pilose, a little longer than the body; joints simple, oval, much shorter than their petioles, which are whitish. Wings nearly limpid; veins blackish; subcostal vein about one-third of the length of the wing; cubital curved, ending at a short distance from the tip of the wing; subanal and first branch of the anal very slight; second branch curved obliquely, but rather abruptly to the hind border. Halteres and legs whitish, the latter long and slender.

Rare. (E.)

89. **pubescens**, n. *Mas, testacea, antennis 14-articulatis nigris corpore longioribus, alis subeinereis, venis testaceis.* Long.  $1\frac{1}{2}$ -2; alar. 4-5 lin.

*Male.* Testaceous. Antennæ black, fourteen-jointed, moniliform, verticillate-pilose, longer than the body; joints nearly round, about half the length of their petioles, which are testaceous; whorls of hairs very long. Wings slightly greyish, pubescent, ciliated; *veins dull testaceous;* subcostal vein rather less than half the length of the wing; cubital curved, ending on the hind border at some little distance from the tip of the wing; subanal distinct; first branch of the anal slight, running near to the subanal; second branch curved obliquely and abruptly to the hind border. Legs long, slender.

Not rare. (E.)

90. **moesta**, n. *Testacea, antennis nigris, alis subeinereis, venis fuscescentibus; Mas, antennis corpore brevioribus; Fœm. antennis corpore multo brevioribus, articulis vix petiolatis, oviductu longissimo.* Long.  $1\frac{1}{2}$ ; alar.  $2\frac{1}{2}$ -3 lin.

Testaceous. Antennæ black, verticillate-pilose. Wings slightly greyish, pubescent, ciliated; veins brownish; subcostal vein less than half the length of the wing; cubital very slightly curved, ending very near the tip of the wing; subanal and first branch of the anal slight; second branch curved very abruptly and hardly obliquely to the hind border. Halteres and legs pale testaceous, the latter rather long and slender. *Male.* Antennæ fourteen-jointed, shorter than the body; joints nearly cylindrical, about four times longer than their petioles. *Fem.* Antennæ fourteen-jointed?, much shorter than the body; joints cylindrical, hardly petiolated. Oviduct very long.

Not common. (E.)

91. **ciliata**, n. *Fem.* obscure testacea, antennis nigris, corpore brevioribus, alis subcinereis late ciliatis, venis nigricantibus, halteribus pedibusque pallide testaceis, oviductu brevi. Long.  $1\frac{3}{4}$ ; alar. 4 lin.

*Fem.* Dull testaceous, pubescent. Antennæ black, fourteen-jointed?, moniliform, verticillate-pilose, shorter than the body; joints simple, nearly oval, with very short petioles. Wings pubescent, slightly greyish, deeply ciliated; veins blackish; subcostal vein much less than half the length of the wing; cubital slightly curved, ending at some little distance from the tip of the wing; subanal distinct; first branch of the anal very slight, running very near the subanal; second branch curved abruptly, and slightly obliquely to the hind border. Halteres pale testaceous. Oviduct short. Legs pale testaceous, pubescent, rather long and slender.

Not common. (E.)

92. **solennis**, n. *Mas*, testacea, gracilis, antennis 14-articulatis corporis longitudine, alis subcinereis, venis nigricantibus, halteribus pale testaceis. Long. 1; alar. 3 lin.

*Male.* Testaceous, slender. Antennæ black, fourteen-jointed, moniliform, verticillate-pilose, as long as the body; joints simple, nearly round, little more than half the length of their petioles. Wings slightly greyish, ciliated; veins blackish; subcostal vein less than half the length of the wing; cubital slightly curved, ending at a little distance from the tip; subanal and first branch of the anal slight; second branch curved abruptly and slightly obliquely to the hind border. Halteres pale testaceous. Legs long, slender.

Not common. (E.)

93. **dumetorum**, Winn. Linn. Ent. viii. 264. 55 (1853). *Mas*, flava, antennis fuscescentibus basi flavis corpore multo longioribus, articulis longe petiolatis, thorace vittis tribus parvis aut fere obsoletis flavo-fuscis, alis limpidis cinereo-pilosis, venis pallide fuscis, halteribus albis, pedibus albido-flavis, femoribus tibiisque anticus supra coxisque nigro-fuscis. Long.  $\frac{3}{4}$  lin.

*Male.* Yellow. Antennæ brownish, yellow at the base, longer by half than the body; double joints as long as their petioles, and towards the

thorax brownish. Wings nearly limpid; *veins brownish*; subcostal vein much less than half the length of the wing; cubital slightly curved, ending near the tip of the wing; subanal distinct; first branch of the anal slight, running close to the subanal; second branch hardly curved, inclined obliquely and rather abruptly to the hind border. Halteres whitish. Legs pale testaceous, long, slender. Oviduct short.

Not common. (E.)

100. **latiuscula**, n. *Fæm. testacea, antennis nigris basi testaceis, thorace vittis tribus fuscis, alis subcinereis latissimis, venis nigricantibus*, oviductu elongato. Lóng. 2; alar. 4 lin.

*Fæm.* Testaceous. Antennæ black, testaceous at the base, submoniliform, slightly verticillate-pilose; joints nearly round, hardly petiolated. *Thorax with three almost confluent brown stripes*, the middle one short. Wings slightly greyish, very broad and iridescent, slightly ciliated; *veins blackish*; subcostal vein about one-third of the length of the wing; cubital curved, ending on the hind border at some little distance from the tip of the wing; subapical straight, distinct along the whole length; subanal curved rather abruptly to the hind border. Oviduct attenuated, as long as the abdomen. Legs rather long and slender.

Rare. In the British Museum.

101. **articulata**, n. *Mas, obscure testacea, capite antennisque nigris, his 26-articulatis corpore paullo longioribus, thoracis disco fuso, alis subcinereis, venis pallide fuscis, halteribus pedibusque pallide testaceis.* Long. 1; alar. 3 lin.

*Male.* Dark testaceous. Head and antennæ black. Antennæ twenty-six-jointed, moniliform, thickly verticillate-pilose, a little longer than the body; joints alternately single and double, or short and long, the short joints rather longer than the petioles. Disc of the thorax brown. Wings slightly greyish; *veins pale brown*; subcostal vein much less than half the length of the wing; cubital very slightly curved, ending at some little distance from the tip of the wing; subanal very distinct; first branch of the anal slight, running very close to the subanal; second branch inclined very abruptly and hardly obliquely to the hind border, forming a nearly right angle. Halteres and legs pale testaceous, the latter long and slender.

Not common. (E.)

102. **mœsta**, n. *Mas, testacea, capite thoracisque disco fuscis, antennis nigris corporis longitudine, alis subcinereis, venis nigris, pedibus pallide testaceis.* Long. 1; alar. 3 lin.

*Male.* Testaceous. Head and disc of the thorax brown. Antennæ black, fourteen-jointed, filiform, very slightly verticillate-pilose, as long as the body; joints long, cylindrical, their petioles very short. Wings slightly greyish, pubescent, ciliated; *veins black*, subcostal vein rather less than half the length of the wing; cubital slightly curved, ending at some little distance behind the tip of the wing; subanal straight, very distinct; first branch of the anal faint, running almost close to the sub-

anal; second branch inclined abruptly to the border, straight, slightly oblique to the other part. Legs pale testaceous, rather long and slender.

Not common. (E.)

103. **Leacheana**, Steph. MSS. Testacea, capite antennisque nigris, thoracis diseo fuseescente, alis subcinereis, venis nigris, *tarsis posticis apices versus albis*; *Mas*, antennis 16-articulatis corpore vix brevioribus, scutello thoracis lateribus abdominisque apice albidis, abdomine fusco; *Fem.* antennis 14-articulatis corpore multo brevioribus, thoracis lateribus anticis albidis. Long. 2-2½; alar. 5-6 lin.

Testaceous. Head and antennæ black. Disc of the thorax brownish. Wings greyish, pubescent, ciliated; veins black; subcostal vein nearly half the length of the wing; cubital curved, ending near the tip of the wing; subanalis distinct; first branch of the anal quite obsolete; second branch curved obliquely and not abruptly to the hind border. Legs long, slender; *hind tarsi white towards the tips*. *Male*. Antennæ sixteen-jointed, moniliform, verticillate-pilose, nearly as long as the body; joints nearly round, much shorter than their petioles, with whorls of very long hairs. Scutellum, sides of the thorax, and tip of the abdomen whitish. Abdomen brown. *Fem.* Antennæ fourteen-jointed, subfiliform, much shorter than the body; joints double, subcylindrical, verticillate-pilose, full four times the length of their petioles. Thorax whitish on each side in front. Oviduct short.

Not common. Found in the autumn, near London, and in the Forest of Dean, Gloucestershire. (E.)

104. **impudica**, Winn. Linn. Ent. viii. 262. 62 (1853). *Mas*, flava, antennis fuscis gracilibus basi flavis eorporo duplo longioribus, articulis duplicatis longi-petiolatis, thorace vittis tribus fuscis, pectore fusco, alis subfuscouscentibus cinereo-hirtis, venis fuscis, halteribus albis apice fuscouscentibus, abdomine fuseescente eano-hirto, pedibus nigro-fuscis subtus albidis. Long.  $\frac{2}{3}$  lin.

*Male*. Yellow. Antennæ brown, slender, yellow at the base, twice the length of the body; double joints as long as their petioles, and towards the base of the antennæ rather longer. Thorax with three brown stripes. Pectus brown. Wings slightly brown; transverse veinlet situate at a little beyond the middle of the subcostal vein; anal vein and its second branch forming a rounded obtuse angle. Halteres white, with brownish tips. Abdomen brownish, with hoary hairs. Legs blackish-brown.

Habits unknown.

105. **tenuicornis**, n. *Mas*, fusco-testacea, capite nigro, *antennis corporis longitudine*, scutello pallide testaceo, alis subcinereis, halteribus albidis, pedibus testaceis. Long. 1; alar. 3 lin.

*Male*. Brownish-testaceous. Head black. Antennæ black, twelve-jointed, subfiliform, verticillate-pilose, as long as the body; joints double, nearly cylindrical, full three times the length of their petioles. Scu-

subcostal vein; anal vein and its second branch forming a rounded, slightly obtuse angle. *Male.* Antennæ somewhat longer than the body; double joints thrice the length of their petioles; whorls snow-white. *Fem.* Antennæ rather more than half the length of the body; joints about five times the length of their petioles. Oviduct short, yellow, with two small oval valves.

Lives on *Pinus sylvestris*, and assumes the pupa state in a white resinous cocoon on the leaves. (E.)

112. **linearis**, n. Pallide fusca, capite antennisque nigris, thoracis dorso fusco, lateribus pectoreque albidis, alis subcervinis, venis fuscis, halteribus albidis; *Mas*, antennis corpore brevioribus, pedibus albidis; *Fœm.* antennis corpore multo brevioribus, pedibus testaccis. Long. 1; alar.  $2\frac{1}{2}$  lin.

Pale brown. Head and antennæ black. Thorax dark brown above; sides and pectus whitish. Wings very slightly fawn-colour; veins brown; subcostal vein much less than half the length of the wing; cubital very slightly curved, ending near the tip of the wing; subanal slight; first branch of the anal obsolete; second branch curved obliquely and not abruptly to the hind border. Halteres whitish. Legs slender, moderately long. *Male.* Antennæ sixteen-jointed?, slender, moniliform, slightly verticillate-pilose, shorter than the body; joints elliptical, a little longer than their petioles, which are testaceous. Legs whitish. *Fem.* Antennæ eleven-jointed, filiform, much shorter than the body; joints cylindrical, more than four times the length of their petioles. Legs testaceous.

Not common. (E.)

113. **digitata**, Winn. Linn. Ent. viii. 272. 64 (1853). Nigra, capite sordide flavo, proboscide palpisque fuscis, scutelli apice nonnunquam flavo, alis longis limpidis nigro-hirtis, venis fuscis, halteribus flavis, abdomine sordide flavo fasciis nigro-fuscis dorso dilatatis, pedibus piceis, tarsis pilosis; *Mas*, antennis corpore paullo longioribus, articulis longi-petiolatis; *Fœm.* antennis corpore multo brevioribus, oviductu corpore longiore laniellis nullis. Long.  $\frac{2}{3}$ - $\frac{3}{4}$  lin.

Black. Head dingy yellow. Wings limpid; transversc veinlet situated a little beyond the middle of the subcostal vein; second branch of the anal vein curved to the hind border. *Male.* Antennæ a little longer than the body; joints as long as their petioles. *Fem.* Antennæ much shorter than the body; joints about five times the length of their petioles. Oviduct longer than the body, without valves; first segment black, shining; second and third yellow.

Habits unknown.

114. **arcuata**, n. *Fœm. nigra*, antennis corpore brevioribus, thoracis lateribus testaceis, alis subcinereis, venis nigris, halteribus albidis, pedibus testaccis. Long.  $1\frac{1}{4}$ ; alar. 4 lin.

*Fem.* Black. Antennæ twelve-jointed?, subfiliform, slightly verticillate-pilose, much shorter than the body; joints cylindrical, about four

times the length of their petioles. *Thorax testaceous on each side.* Wings slightly greyish, not ciliated; veins black; subcostal vein much less than half the length of the wing; cubital curved, ending near the tip of the wing; subanal distinct; first branch of the anal slight, running very near the subanal; second branch curved very abruptly and hardly obliquely to the hind border. Halteres whitish. Oviduct short. Legs dull testaceous, long, slender.

Not common. (E.)

115. **præcox**, Winn. Linn. Ent. viii. 276. 66 (1853). *Fœm. nigra*, palpis fuscis, antennis corpore brevioribus, articulorum petiolis brevissimis, thorace e pilis flavis bivittato, scutello fusco-ruso, alis subcinereis nigro-cinereo-pilosis, venis nigro-fuscis, halteribus pallide fuscis, abdomine nigro-fuscis incisuris albidis, oviductu longissimo lamellis duabus minimis, pedibus obscure fuscis. Long.  $1\frac{1}{3}$  lin.

*Fem. Black.* Palpi brown. Antennæ shorter than the body; joints six times the length of their petioles. Thorax with two stripes of yellow hairs; *scutellum ferruginous*. Wings greyish; transverse veinlet situate at some distance before the middle of the subcostal vein; anal vein and its second branch forming an almost right angle. Oviduct very long, brownish-yellow, with two very small valves.

Appears in March in woods, especially on fresh-split oak stack-wood.

116. **conformis**, n. *Fœm. nigro-fusca*, capite nigro, antenuis nigris corpore brevioribus, scutello thoracisque lateribus pallide testaceis, alis subcinereis, venis nigris, halteribus albis, pedibus testaceis. Long.  $1\frac{1}{2}$ ; alar. 4 lin.

*Fem. Blackish-brown.* Head black. Antennæ black, twelve-jointed?, verticillate-pilose, shorter than the body; joints subcylindrical, full thrice the length of their petioles. *Scutellum and sides of the thorax in front and at the base of the wings pale testaceous.* Wings greyish; veins black; subcostal vein less than half the length of the wing; cubital curved, ending at some little distance from the tip; subanal distinct; first branch of the anal slight, running almost close to the subanal; second branch inclined obliquely and rather abruptly to the hind border. Halteres white. Legs dull testaceous, long, rather slender.

Not common. (E.)

117. **tendens**, n. *Mas, pallide fusca, capite thoracisque disco nigro-fuscis*, antennis 24-articulatis corporis longitudine, alis subcinereis, venis nigricantibus, halteribus pedibusque albidis. Long. 2; alar. 6 lin.

*Male. Pale brown, slender, linear. Head, disc of the thorax, and metathorax blackish-brown.* Antennæ twenty-four-jointed, submonili-form, slightly verticillate-pilose, as long as the body; petiole of each joint as long as the incrassated elliptical part. Wings greyish, hardly ciliated; veins blackish; subcostal vein very little less than half the length of the wing; cubital slightly curved, ending on the hind border at a short distance from the tip; subapical apparent along the apical

*white, with four brown spots; transverse veinlet at a little beyond the middle of the subcostal vein; anal vein and its second branch forming an almost right angle. Halteres white. Legs pale brown, yellow beneath. Male. Antennæ longer by half than the body; double joints very little shorter than their petioles. Fem. Antennæ five-sixths of the length of the body; joints almost sessile. Oviduct with two oval valves.*

Feeds on *Ceoma miniatum*, growing on the fallen leaves of the rose; changes in the earth.

124. **Cerasi**, Loew, Pr. Pos. Gymn. 35. 19 (1850); Winn. Fulva, capite thoracisque disco nigro-fuscis aut castaneo-fuscis, antennis fuscis basi flavis, pectore nigro, *alis subcinereis* valde pilosis, venis fuscis, halteribus albo-flavis apice fuscis, abdomine sordide fusco-flavo incisuris nigricantibus, pedibus nigro-fuscis subtus albo-nitentibus, femoribus basi tarsisque posticis pallide flavis; *Mas*, antennis corpore fere duplo longioribus, articulis duplicatis longi-petiolatis; *Fœm.* antennis corpore brevioribus, articulorum petioli brevissimis, oviduetu brevi lamellis duabus ovatis. Long.  $\frac{3}{4}$ -1 lin.

Tawny. Disc of the thorax brown. *Wings greyish*; transverse veinlet joining the middle of the subcostal vein; anal vein and its second branch forming an almost right angle. Legs blackish-brown; femora at the base and hind tarsi pale yellow. *Male.* Antennæ nearly twice the length of the body; double joints rather shorter than their petioles. *Fem.* Antennæ about two-thirds of the length of the body; joints five times the length of their petioles. Oviduct short, with two oval valves.

Feeds on the leaves of the Cherry, of the White-thorn, and of *Chenopodium*.

125. **ciliipes**, Winn. Linn. Ent. viii. 280. 70 (1853). Fulva, antennis fuscis basi flavis, thorace vittis tribus contiguis nigro-fuscis, pectore nigricante, *alis fuscescentibus* nigro-cinereo-pilosis, venis nigris, halteribus fuscis basi albo-flavis, abdomine fusco-flavo albo-hirto, *pedibus pilosis nigris longissimis subtus albidis, tarsorum articulis tertio ad quintum albicantibus*; *Mas*, antennis corpore multo longioribus, articulis duplicatis longi-petiolatis; *Fœm.* antennis corpore brevioribus, articulorum petioli brevissimis, oviduetu brevi lamellis duabus ovatis. Long. 1 lin.

Tawny. Thorax with three blackish-brown stripes. *Wings brownish*; transverse veinlet joining the middle of the subcostal vein; anal vein and its second branch forming a rounded obtuse angle. *Legs hairy, very long, black, whitish beneath; third, fourth, and fifth joints of the tarsi whitish.* *Male.* Antennæ longer by half than the body; double joints rather shorter than their petioles. *Fem.* Antennæ about two-thirds of the length of the body; joints six times the length of their petioles. Oviduct short, with two oval valves.

Lives in decayed wood of *Fagus sylvatica*.

126. **decorata**, Winn. Linn. Ent. viii. 281. 71 (1853). Fulva,

capite flavo, antennis fuseis basi flavis, thorace vittis tribus nigris eontiguis, pectore nigricante maculis lateralibus nigro-cinereis, *alis fuscescentibus* nigro-cinereo pilosis, venis nigris, halteribus fuscescentibus basi flavescentibus, abdomine fusco-flavo cinereo-hirtissimo, *pedibus nigro-fasciatis*; *Mas*, antennis corpore multo longioribus, articulis duplicatis longi-petiolatis; *Fæm.* antennis corpore brevioribus, articulorum petiolis brevissimis, oviductu brevi lamellis duabus ovatis. Long.  $1\frac{1}{4}$  lin.

Tawny. Thorax with three black stripes. *Wings brownish*; transverse veinlet situate a little beyond the middle of the subcostal vein; anal vein and its second branch forming a rounded obtuse angle. Legs with black bands. *Male*. Antennæ longer by one-third than the body, like those of *C. Cerasi*, but with shorter hairs on the upper side. *Fem.* Antennæ rather more than half the length of the body; joints five times the length of their petioles. Oviduct short, with two oval valves.

Lives in decayed beech-wood.

The following species also belong to the Subgenus *Diplosis* :—

*C. Anthemidis*, Loew. In the flowers of *Anthemis arvensis*.

*C. guttata*, Loew.

*C. pavonia*, Loew.

*C. tenuis*, Loew.

*C. Jacobææ*, Loew. In the flowers of *Senecio Jacobæa*.

*C. unicolor*, Loew.

*C. simplex*, Loew.

*C. Inulæ*, Loew. Lives in galls on *Inula Britannica*.

*C. braehyntera*, Schwægr.

**127. Sarothamni**, Loew, Pr. Pos. Gymn. 38. 48 (1850); Winn. *Nigro-cinerea*, capite, pectore antico, alis basi, metathorace sculellaque fulvis, antennis nigro-fuscis, alis fuscescentibus nigro-cinereo-hirtis, venis nigro-fuscis, halteribus fulvis, capitulis subtus ex parte fuscis, abdomine fusco subtus albo-hirto, pedibus piceis aut nigro-fuseis, femoribus sèpissime pallidioribus; *Mas*, antennis 15-articulatis corporis longitudine; *Fæm.* antennis 14-articulatis corporis dimidio non longioribus, oviductu longissimo valde acuminato lamellis nullis. Long.  $2-2\frac{1}{4}$  lin.

Blackish-grey. Head, pectus in front, wings at the base, metathorax, and sculellum tawny. *Wings brownish*; transverse veinlet situate at about one-fourth of the length of the subcostal vein; second branch of the anal vein curved to the hind border. *Male*. Antennæ fifteen-jointed, as long as the body. *Fem.* Antennæ fourteen-jointed, about half the length of the body. Oviduct very long, brownish-yellow, much acuminated, without valves.

Lives in bud-like galls on the twigs of *Sarothamnus scoparius*.

**128. innotata**, n. *Mas*, *fusca*, capite antennis thoracisque disco nigris, antennis corpore brevioribus, *thorace postico testaceo*, *alis obscure cinereis* albo-subnubulosis, venis nigris, abdominis lateribus albido-vittatis, *pedibus validis*. Long. 2; alar. 4 lin.

*about twenty-five joints, less than half the length of the body; joints approximate, nearly oval, not petiolated. Thorax advanced over the head, with three tawny stripes. Wings grey, rather short and narrow; veins darker, as in *C. ampla*. Abdomen brown. Legs brown, stout; tarsi curved. Var.  $\beta$ . Abdomen tawny.*

Not common. In the British Museum. (E. S.)

The following species seem to be nearly allied to *C. extrema* :—  
*C. producta*, Meig. *C. rosea*, Zett. *C. protuberans*, Zett. *C. hirtipes*, Zett. *C. immunda*, Zett.

135. **funesta**, n. *Mas, nigra, thorace obscure ferrugineo vittis tribus nigris, alis cinereis, venis nigris, pedibus validis longis. Long. 2; alar. 4 lin.*

*Male. Black. Antennæ submoniliform; joints a little longer than broad. Thorax dark ferruginous, with three black stripes. Wings grey; veins black; subcostal vein much more than half the length of the wing; cubital very slightly curved, ending on the hind border at some little distance from the tip; subapical indicated by a streak; second branch of the subanal curved abruptly to the border, forming a very acute angle with the first, which is very indistinct. Legs long, stout.*

Rare. In the British Museum. (E.) This may be the male of *C. extrema*.

136. **ampla**, n. *Testacea, antennis fuscis 25-articulatis corporis dimidio fere longioribus, thorace vittis tribus fuscis, alis subcinereis, abdomine univittato, pedibus longis. Long. 3; alar. 7 lin.*

*Testaceous. Antennæ brown, with about twenty-five joints; joints nearly oval. Thorax with three tawny stripes. Wings very slightly greyish; veins pale; subcostal vein ending at half the length of the wing; cubital ending at the tip; subapical ending at about half the distance from the cubital and the subanal, the latter abruptly curved to the border towards its tip. Abdomen with a slight darker dorsal stripe. Legs long, rather slender. Male. Antennæ moniliform, verticillate-pilose, a little shorter than the body; joints petiolated. Abdomen brownish; hind borders of the segments pale testaceous. Fem. Antennæ submoniliform, full half the length of the body, slightly verticillate-pilose; joints approximate, hardly petiolated. Abdomen with a slight dark tawny dorsal stripe.*

Rare. (E.)

137. **crassipes**, Loew, Pr. Pos. Gym. iv. 31. 2. *Fœm. fulva, antennis fuscis 16-articulatis verticillato-pilosis, thorace fusco-trifasciato, alis subcinereis, halteribus pedibusque nigro-fuscis, his crassis. Long. 2 lin.*

*Fem. Tawny. Antennæ brown, sixteen-jointed, verticillate-pilose; the last joint small, often not distinct. Thorax with three indistinct darker stripes. Wings greyish; their pubescence brown along the fore*

border, paler along the hind border. Halteres blackish-brown. Abdomen reddish. Oviduct not exserted. Legs blackish-brown, stout.

The oviduct is retracted in the preceding species of this subgenus; in *C. cornuta*, Bremi, it is extended.

138. **Fagi**, Hartig, Jahresberichte i. 4 (1836); Loew; Winn. *Nigro-fusca*, capite nigro, thorace trisulcato lateribus carneis, alis sublimpidis cinereo-pilosus, venis pallide fuscis, costa nigro-fusea, halteribus fulvis, abdomen obscure carneo, femoribus basi flaveseentibus; *Mas*, antennis 24-artieulatis corpore longioribus, articulis longi-petiolatis; *Fæm.* antennis artieulis 20-22 non petiolatis, oviductu fulvo brevi lamellis duabus rotundatis. Long.  $2-2\frac{1}{2}$  lin.

*Blackish-brown.* Head black. Thorax with three furrows, flesh-colour on each side. Wings nearly limpid; anal vein and its second branches forming a slightly obtuse angle. Abdomen dull flesh-colour. Femora yellowish at the base. *Male.* Antennæ twenty-four-jointed, longer by one-fourth than the body; joints as long as their petioles. *Fem.* Antennæ twenty- to twenty-two-jointed, one-third of the length of the body; joints not petiolated. Oviduct tawny, short, with two round valves.

Lives in the pyramidal galls on the leaves of *Fagus sylvatica*. These occur in great numbers on the beech-trees near Interlacken, in Switzerland, and are different from the slender horn-shaped galls which appear on the beech-leaves near London. (E.?)

139. **piligera**, Loew, Pr. Pos. Gymn. 32. 6 (1850); Winn.—*annulipes*, Hartig. *Nigro-fusca*, palpis pallide fusceseentibus, antennis 17-20-artieulatis fusceseentibus, thoracis lateribus abdomenque carneis, alis limpidis cinereo-hirtis, venis fusceseentibus, costa nigro-fusea, halteribus basi flavis, pedibus subtus albicantibus; *Mas*, antennis corpore paullo longioribus, articulis brevi-petiolatis; *Fæm.* antennis corporis dimidio non longioribus, artieulis non petiolatis, oviductu elongato flavo lamellis nullis. Long.  $1\frac{1}{4}-1\frac{1}{2}$  lin.

*Blackish-brown.* Antennæ with eighteen or twenty joints, rarely with seventeen joints. Thorax on each side and abdomen flesh-colour. Wings limpid; anal vein and its second branch forming a slightly obtuse angle. *Male.* Antennæ a little longer than the body; joints longer by one-third than their petioles. *Fem.* Antennæ as long as the head and the thorax together; joints not petiolated. Oviduct elongated, yellow, without valves.

Lives in hairy galls on the leaves of *Fagus sylvatica*.

140. **elegans**, Winn. Linn. Ent. viii. 287. 76 (1853). *Mas, nigra, nitida*, antennis 20-artieulatis fuseis corpore paullo brevioribus, articulis longi-petiolatis, thoracis lateribus carneis, alis subcinereis cinereo-pilosus, venis fuseis, halteribus basi albis, abdomen nigro-fusco incisuris albis, pedibus subtus vix albicantibus. Long.  $1\frac{1}{4}$  lin.

*Male. Black, shining.* Antennæ twenty-jointed, brown, shorter by

Lives on *Poa nemoralis*, and forms oval, rough galls, in which it assumes the winged state.

*C. amœna*, Loew, and *C. gibba*, Zett., also belong to the Subgenus *Hormomyia*.

146. **angustipennis**, Winn. Linn. Ent. viii. 293. 82 (1853).  
*Fæm.* *flava*, antennis basi flavis 13-articulatis corporis longitidine, articulis medioeriter petiolatis, thorace vittis tribus fuscis, alis longissimis angustis subfuscouscentibus, venis fuscis, oviductu brevi lamellis duabus longi-ovatis, pedibus fuscis longissimis. Long.  $\frac{1}{2}$  lin.

*Fem.* Yellow. Antennæ thirteen-jointed, brown, yellow at the base; joints about twice the length of their petioles. Thorax with three brown stripes. Wings brownish, narrow, very long; veins brown; transverse veinlet at three-fourths of the length of the subcostal vein. Halteres yellow, with brown knobs. Oviduct short, with two elongated oval valves. Legs brown, very long; second joint of the tarsi much longer than the tibiæ.

Lives in decayed beech-wood.

*Note.* Loew's subgenus *Dirhiza* contains only one species, *D. lateritia*, Loew.

147. **defecta**, Loew, Pr. Pos. Gymn. 38. 57 (1850); Winn. *Pallide flava*, alis longis angustis fere limpidis, venis pallide fuscescentibus, halteribus albis, pedibus pallide fuscescentibus, tarsis apice albidis; *Mas*, antennis 15-articulatis pallide fuscis corpore duplo longioribus basi petiolisque albo-flavis, his longissimis; *Fæm.* antennis 13-articulatis fuscis basi flavis eorpore vix brevioribus, petiolis brevioribus, oviduetu sat longo lamellis nullis. Long. fere 1 lin.

Pale yellow. Wings nearly limpid. Halteres white. Legs pale brown; fourth and fifth joints of the tarsi whitish. *Male.* Antennæ fifteen-jointed, pale brown, twice the length of the body; joints half the length of their petioles, which are whitish-yellow. *Fem.* Antennæ thirteen-jointed, brown, yellow at the base, almost as long as the body; joints twice the length of their petioles. Oviduct moderately long, generally retracted, without valves.

Lives in decayed beech-wood.

148. **gracilis**, Winn. Linn. Ent. viii. 298. 89 (1853). *Flava*, antennis fuscis basi flavis, thorace vittis tribus nigro-fuscis, alis sublimpidis, venis fuscis, halteribus pallide fuscis basi albis, *abdomine flavescente fusco incisuris pallidioribus*, pedibus fuscescentibus aut nigro-fuscis, tarsis apice niveis; *Mas*, antennis 16-articulatis corpore longioribus, artieulorum petiolis longissimis; *Fæm.* antennis 13-articulatis corpore brevioribus, petiolis abbreviatis, abdomine toto flavo, oviductu brevi lamellis duabus ovatis. Long. 1 lin.

*Yellow.* Antennæ brown. *Thorax with three blackish-brown stripes.* Wings nearly limpid; anal vein and its second branch forming an almost right angle. *Abdomen yellowish-brown, with pale sutures.* Legs

brownish or blackish-brown; third, fourth, and fifth joints of the tarsi snow-white. *Male.* Antennæ sixteen-jointed, longer by half than the body; joints half the length of their petioles. *Fem.* Antennæ thirteen-jointed, shorter by one-third than the body; joints three times the length of their petioles. Oviduct short, retracted, with two oval valves.

Lives on decayed wood.

149. **valvata**, Winn. Linn. Ent. viii. 302. 94 (1853). *Fœm. flava*, antennis 24-articulatis pallide fuscis basi flavis corpore brevioribus, articulorum petiolis abbreviatis, palpis albidis longissimis, thorace vittis tribus castaneo-fuscis, alis sublimpidis cinereo-hirtis, venis fuseescentibus, oviductu crasso, valvulis duabus apicalibus nigris, lamellisque duabus parvis rotundis, pedibus longissimis pieeis, tarsis apice niveis. Long. 1 lin.

*Fœm. Yellow.* Antennæ twenty-four-jointed, pale brown, yellow at the base, shorter by one-third than the body; some of the joints about three the length of their petioles; five or six apical joints without petioles. Palpi whitish, very long. Thorax with three chestnut-brown stripes. Wings nearly limpid, with grey pubescence; veins brownish; anal vein and its second branch forming an almost right angle. Abdomen clothed with hoary hairs. Oviduct long, stout, yellow, *with two black apical valves, between which is the aperture of the oviduct*, and two very small round valves. Legs pieous, very long, whitish beneath; third, fourth, and fifth joints of the tarsi snow-white.

Found on the decayed stems of *Carpinus Betula*.

150. **nodicornis**, Winn. Linn. Ent. viii. 300. 92 (1853). *Flava*, antennis fuscis basi flavis, thorace vittis tribus nigro-fuscis, pectore nigricante, alis subcinercis cinereo-pilosis, venis fuscis; *Mas*, antennis 21-articulatis corpore longioribus, articulorum petiolis elongatis, halteribus albis, pedibus pallide fuscescentibus, femoribus basi flavis, tarsis apice niveis; *Fœm. antennis* 26-articulatis corpore brevioribus, petiolis brevissimis, oviductu elongato lamellis duabus parvis longi-ovatis, pedibus nigro-fuseis, femoribus basi subtusque flavescentibus, tarsis apice niveis. Long. 1-1½ lin.

*Yellow.* Antennæ brown. *Thorax with three blackish-brown stripes.* Peetus blackish. Wings greyish; transverse veinlet situate at a little before two-thirds of the length of the subcostal vein; anal vein and its second branch forming a rounded, slightly obtuse angle. *Male.* Antennæ twenty-one-jointed, longer by nearly half than the body; joints and petioles of almost equal length towards the base, the latter longer in the middle, but much shorter in the apical part of the antennæ. *Fœm.* Antennæ twenty-six-jointed, shorter by one-third than the body; joints about four or five times the length of the petioles. Oviduct elongated, with two very small elongate-oval valves.

Lives on decayed beech-wood.

151. **nemoralis**, Winn. Linn. Ent. viii. 302. 93 (1853). *Fœm.*

*dish-brown stripes.* Wings brownish, with grey pubescence; veins brown; anal vein and its second branch forming an obtuse angle. Legs long, pale brownish; tarsi whitish.

Lives on decayed wood.

158. **analis**, Winn. Linn. Ent. viii. 300. 91 (1853). *Mas, nigra*, antennis 16-articulatis corpore longioribus, articulorum petiolis elongatis, humeris alis basi scutello et metathorace fulvis, peetore nigro-cinereo, alis subfuscocentibus cinereo-pilosis, venis fuseis, halteribus albis, abdomine sordide fusco-flavo incisuris nigricantibus, pedibus longissimis nigro-fuscis, femoribus basi carneis. Long. 1 lin.

*Male.* Blaek. Antennæ sixteen-jointed, half as long again as the body, yellow at the base; petioles towards the base as long as the joints, longer by half towards the middle, and shorter towards the tips of the antennæ. *Humeri, wings at the base, scutellum, and metathorax tawny.* Peetus blackish-brown. Wings brownish, with grey pubescence; veins brown; second branch of the anal vein curved to the hind border. Halteres white. *Abdomen dingy brownish-yellow; sutures blackish.* Legs blackish-brown, very long; femora flesh-colour at the base.

Habits unknown.

159. **nigrina**, n. *Fœm. nigra*, antennis 12-articulatis corpore multo brevioribus, alis angustis subcinereis, venis nigricantibus, halteribus pedibusque fuscis, oviductu longissimo. Long.  $\frac{3}{4}$ ; alar. 2 lin.

*Fem. Black.* Antennæ twelve-jointed, submoniliform, much shorter than the body; joints nearly elliptical, with very short petioles. Wings narrow, slightly greyish; veins blackish; subcostal vein nearly half the length of the wing; cubital almost straight, ending at a little behind the tip of the wing; subanal and first branch of the anal almost obsolete; second branch curved obliquely and not abruptly to the hind border. Halteres and legs brown, the latter moderately long and slender. Oviduct as long as the body.

Not rare. (E.)

The Subgen. *Epidosis* also includes the three following species:—

*C. fragilis*, Loew.

*C. longipcs*, Loew.

*C. sericata*, Loew.

160. **pectoralis**, Winn. Linn. Ent. viii. 303. 95 (1853). Fulva, capite flavo, antennis pallide fuscis basi flavis, thorace vittis tribus fuseis aut nigris, alis limpidis eincreo-hirtis, venis fuseis, halteribus albidis, pedibus pallidis, femoribus tibiisque supra tarsisque fuscocentibus; *Mas*, antennis 16–24-articulatis corpore longioribus longi-verticillato-pilosus, petiolis longis; *Fœm.* antennis 15–26-articulatis corpore brevioribus, articulorum petiolis brevissimis aut nullis, oviductu elongato lamellis duabus parvis longiusculis. Long.  $\frac{1}{2}$ –1 lin.

Tawny. Head yellow. Antennæ pale brown, yellow at the base. Thorax with three brown or black stripes. Wings limpid, with grey

pubescence; veins brown; cubital vein ending almost at the tip of the wing; anal curved to the hind border. Halteres whitish. Abdomen with hoary hairs. Legs pale; femora and tibiæ above and tarsi brownish. *Male*. Antennæ sixteen- to twenty-four-jointed, longer by half than the body; joints as long as their petioles, longer in some parts. *Fem.* Antennæ fifteen- to twenty-six-jointed, shorter by one-third than the body; petioles very short or none. Oviduct long, with two small elongated valves.

Habits unknown.

161. ***lugubris***, Winn. Linn. Ent. viii. 305. 96 (1853). *Fusco-flava*, palpis pilosis, antennis 14-articulatis, thoraceis disco nigro-fusco nitido, *alis nigricantibus* nigro-hirtis, halteribus sordide flavis, capitulis nigris, femoribus tibiisque nigro-fuscis subtus flavis, tarsis nigris; *Mas*, antennis corpore vix brevioribus, articulorum petiolis elongatis; *Fœm.* antennis corporis dimidio non longioribus, petiolis brevissimis, oviductu clavigato lamellis duabus longiusculis. Long.  $1\frac{1}{3}$  lin.

*Brownish-yellow.* Palpi pilose. Antennæ fourteen-jointed. Disc of the thorax blackish-brown, shining. Wings blackish, with black pubescence, appearing whitish in some aspects; cubital vein ending at the tip of the wing; anal vein more or less curved to the hind border. Halteres dingy yellow, with black knobs. Abdomen with hoary hairs. Femora and tibiæ blackish-brown, yellow beneath; tarsi black. *Male*. Antennæ almost as long as the body; joints twice the length of the petioles. *Fem.* Antennæ half the length of the body; joints five times the length of the petioles. Oviduct elongated, with two rather long valves.

Lives in decayed wood, and in *Polyporus versicolor*.

162. ***tenella***, n. *Testacea*, antennis nigris verticillato-pilosis, *alis limpidis* basi perangustis, venis testaceis; *Mas*, antennis corpore duplo longioribus; *Fœm.* antennis corpore multo brevioribus, oviductu brevi. Long.  $1-1\frac{1}{4}$ ; alar.  $3\frac{1}{2}$  lin.

*Testaceous.* Antennæ black, verticillate-pilose. *Wings limpид*, very narrow towards the base; veins testaceous; subcostal vein about one-third of the length of the wing; cubital curved towards the tip of the wing parallel to the border, ending near the tip; subanal slight; first branch of the anal obsolete; second branch curved abruptly and slightly obliquely to the border. *Male*. Antennæ sixteen-jointed?, about twice the length of the body; joints round, hardly half the length of their petioles, which are testaceous; whorls of hairs very long. *Fem.* Antennæ twelve-jointed?, much shorter than the body; joints nearly cylindrical, with very short petioles. Oviduct short.

Rare. (E.)

The three following species belong to the Subgen. *Asynapta*:-

C. longieollis, Loew.

C. longicauda, Loew.

C. Bouchéana, Loew. *Salicis*, Bouché.

Many other species have been described, but their economy has not been ascertained, and the characters assigned to them are not sufficiently definite.

The following additional species have been recorded as British :—

1. C. grandis, *Meig.* *Zw.* i. 94. 1 (1818).
  2. C. lateralis, *Meig.* *Zw.* i. 96. 5 (1818).
  3. C. palustris, *Linn.* *Faun. Suec.* 1775 (1761).
  4. C. nigricollis, *Meig.* *Zw.* i. 97. 8 (1818).
  5. C. griseola, *Meig.* *Zw.* i. 97. 9 (1818).
  6. C. griscicollis, *Meig.* *Zw.* i. 97. 10 (1818).
  7. C. bicolor, *Meig.* *Zw.* i. 98. 12 (1818).
  8. C. carnea, *Meig.* *Zw.* i. 98. 13 (1818).
  9. C. fuscipennis, *Meig.* *Zw.* i. 98. 14 (1818).
  10. C. lutea, *Meig.* *Zw.* i. 99. 16 (1818).
  11. C. pictipennis, *Meig.* *Zw.* vi. 270. 27 (1830).
- 

## Genus II. LASIOPTERA.

*Lasioptera* p., *Meig.* *Zw.* i. 88 (1818); *Mcq.*; *Zett.*; *Loew*; *Winn.*; *Rondani*. Subgen. *Lasioptera et Clinorhyncha*, *Loew*; *Winn.* *Tipula* p., *Schr.* *Cecidomyia* p., *Meig.* *Kl. Zw.*

Corpus parvum aut minimum. Caput parvum, rotundatum. Oculi lunati. *Ocelli nulli*. Proboscis brevissima. Palpi exserti, 4-articulati; articuli primus et secundus crassiores; tertius et quartus tenuiores. Antennæ 12–24-articulatae, porrectæ, submoniliformes, corpore breviore, articulis approximatis. Thorax ovatus. *Alæ* incumbentes, latae, pubescentes, ciliatae; *venæ cubitalis et subapicalis obsolete*, subanalis distincta, analis plus minusve obsolete furcata. Abdomen cylindricum, segmentis 8. Pedes plerumque longi, gracieles, tarsis longissimis, metatarso sœpissime brevissimo.

Body delicate, small or very small. Head small, sphæroidal, sessile. Eyes lunate. *Ocelli none*. Proboscis very short. Palpi exserted, four-jointed; first and second joints thicker than the others. Antennæ porrect, twelve- to twenty-four-jointed, not much longer than the head and the thorax together, submoniliform; joints approximate, somewhat hairy. Thorax oval. Wings incumbent, broad, hairy, ciliated; costa in some species thickened, and concealing the mediastinal and subcostal veins; *cubital and subapical veins obsolete*; subanal distinct; anal forked, the first branch indistinct or obsolete. Abdomen cylindrical, with eight segments. Legs generally long and slender; tarsi very long; metatarsus most often very short.

The *Lasiopterae* infest plants, and are nearly similar to the *Cecidomyiae* in their habits and economy. The species are few in number, and generally of rare occurrence.

*a.* Metatarsus short.

*b.* Abdomen with yellow bands. Species 1.

*b b.* Abdomen wholly black. Species 2.

*a a.* Metatarsus long. Species 3.

1.  **picta**, Meig. Zw. i. 89. 1 (1818); Winn. *Picea, capite, halteribus abdominis fuscis interruptis ventreque flavis, antennis nigris, thoracis lateribus pectoreque fulvis, alis limpidis, tibiis apice tarsisq[ue] nigris.* Long.  $1\frac{1}{4}$ ; alar. 3 lin.

*Piceous. Head yellow. Antennæ black. Thorax tawny on each side and beneath. Wings limpid; veins and cilia black; costa apparently thick, the costal, mediastinal, and subcostal veins being contiguous; subanial vein straight; anal indistinctly forked, forming with its second branch an extremely obtuse angle, its first branch almost obsolete. Halteres yellow. Abdomen with an interrupted yellow band on each segment; underside yellow. Legs long, slender, yellow; tarsi longer than the tibiae; hind tarsi about thrice the length of the tibiae; tarsi and tips of the tibiae black.*

Rare. In the British Museum. (E.)

2.  **albipennis**, Kl. Zw. i. 40. 5 (1804). *Atra, alis limpidis apice subcinereis, venis nigris, costa albo-uniguttata, pedibus piceis validiusculis.* Long.  $1\frac{1}{4}$ ; alar. 3 lin.

*Deep black. Wings limpid, greyish at the tips; veins and cilia black; costa with a white spot at the tip of the subcostal vein; subcostal and mediastinal veins distinct, separate; subanial vein straight; anal forming with its second branch a slightly curved line; first branch indistinct, very near the anal vein. Legs piceous, rather stout, moderately long; tarsi longer than the tibiae.*

Rare. In the British Museum. (E.)

3.  **stygia**, Hoffm. MSS.; Meig. Zw. i. 91. 7 (1818). *Obscure fusca, subtus sordide flava, antennis nigris, alis nigro-cinereis pubescens-tibus, venis nigris, pedibus validiusculis albidis.* Long.  $\frac{3}{4}$ ; alar. 2 lin.

*Brownish, dingy yellow beneath. Antennæ black. Wings dark grey, very thickly pubescent; veins black; subcostal vein distinct, ending at beyond three-fourths of the length; subanial distinct, indistinctly forked towards its tip; anal forming a very obtuse angle near its tip; the fore branch obsolete. Legs rather stout, moderately long, with whitish reflections; metatarsus longer than any of the following joints.*

Rare. (E.)

*Lasioptera Rubi*, Schr., lives in excrescences on the stems of different species of *Rubus*, and probably is also a British species. *L. auricincta*, Winn., lives at the roots of *Festuca pratensis*, changes to a pupa in a snow-white covering, and appears two weeks afterwards in the fly state.

---

*c c c c.* Thorax and abdomen of the male partly with black, partly with pale hairs. Species 10.

*a a a.* Legs of the male black, of the female red. Species 11, 12.

1. **Marci**, L. S. N. ii. 976. 38 (1767); D. G.; F.; Gmel.; Geoff.; Schr.; Panz.; Meig.; Mcq.; Loew; Gim.; Zett.—*brevicornis* (*mas*), L.; F.; Gmel.—*febrilis*, Z.; F.; Schr.; Gmel. Ater, nigro-pilosus; *Mas*, alis albis ad costam nigricantibus, stigmate nigricante, venis albis apud costam nigris; *Fæm.* alis fuscis ad costam nigricantibus, venis fuscis apud costam nigris. Long. 4–5; alar. 8–10 lin.

Deep black, clothed with black hairs. Male. Wings white, blackish along the costa; stigma blackish; veins towards the costa black, the rest white. Fem. Wings brown, blackish along the costa; veins towards the costa and stigma black, the rest pale brown.

Generally distributed. Its appearance is nearly contemporaneous with St. Mark's day, whence its name. (E. S. I.)

2. **leucopterus**, Meig. Kl. Zw. i. 110. 5 (1804); Hal.; Zett. Ater, nigro-pilosus; *Mas*, alis albis, venis albis apud costam nigris; *Fæm.* alis nigricantibus. Long. 3–4; alar. 6–8 lin.

Black. Male. Body clothed with black hairs. Wings white; veins towards the costa and stigma black, the other veins white. Fem. Wings blackish, darker along the costa; stigma and veins black.

Not common. A vernal species. (E. I.)

3. **hortulanus**, L. S. N. ii. 977. 46 (1767); Geoff.; F.; Gmel.; Rossi; Schr.; Latr.; Meig.; Mcq.; Gim.; Loew; Zett. Niger, *albido-hirtus*; *Mas*, alis limpidis ad costam fuscis, venis albis apud costam nigro-fuscis; *Fæm.* thoracis dorso abdomineque rufo-luteis, alis cinereis ad costam fuscis. Long. 3–4; alar. 6–8 lin.

Black. Body clothed with whitish hairs. Male. Wings limpid, brown along the costa; stigma and veins towards the costa blackish-brown; the other veins white. Fem. Thorax above and abdomen reddish-luteous. Wings grey, brown along the costa; veins towards the costa and stigma blackish-brown; the other veins whitish.

Not rare. A vernal species. (E. S. I.)

4. **venosus**, Meig. Zw. i. 315. 10 (1818); Curt. ! B. E. 138; Mcq.; Guér.; Zett.—*nervosa*, Meig. Kl. Zw. Niger, *albido-pilosus*, alis *albido-hyalinis*, stigmate minore nigro subovato, venis pallide fuscis basi albis apud costam nigris. Long. 3½–4; alar. 7–8 lin.

Black, clothed with whitish hairs. Wings whitish-hyaline; stigma rather small, black, nearly oval; veins towards the costa black; the rest pale brownish, white towards the base.

Not common. A vernal species. (E.)

5. **Pomonæ**, F. Sp. Ins. ii. 410. 52 (1781); Gmel.; Herbst; Donov.; Latr.; Meig.; Mcq.; Gim.; Locw.; Zett. Niger, nigro-pilosus, alis limpidis, stigmate nigricante, venis albis apud costam nigris, femoribus rufis. Long. 3½–4½; alar. 7–9 lin.

Black, clothed with black hairs. Wings limpid; stigma blackish; veins towards the costa black, the rest white. Femora red.

Not rare. Vernal and autumnal. (E. S. I.)

6. **Johannis**, L. S. N. ii. 976. 41 (1767); D. G.; Geoff.; Latr.; Meig.; Mcq.; Gim.; Zett.; Loew.—*Pyri*, F.—*præcox*, F.—*hyalina*, Meig. Kl. Zw.—*Pomonæ*, Schr.—*Marci?* Schr. Niger; *Mas*, nigro-pilosus, alis albis, venis albis apud costam nigris, tibiis tarsisque rufescens; *Fœm.* alis subcinereis, venis pallide fuscis apud costam obscurioribus. Long.  $2\frac{1}{2}$ —3; alar. 5—6 lin.

Black. *Male*. Clothed with black hairs. Wings white; stigma and veins towards the costa black, the other veins white. Tibiæ and tarsi reddish, the latter black towards the tips. *Fem.* Clothed with short black hairs. Wings slightly greyish; veins towards the costa and stigma brown, the other veins pale brown.

Generally distributed. Its appearance is nearly contemporaneous with St. John's day, whence its name. (E. S. I.)

7. **ferruginatus**, L. S. N. ii. 976 (1767); F.; Gmel.; Meig.; Mcq.; Gim.; Loew; Zett.—*flavicaudis*, D. G.—*fulviventris?* Meg.; Meig. Niger; *Mas*, nigro-pilosus, alis cinereis ad costam fuscescentibus, abdomine albo-piloso, *tarsis rufescens*; *Fœm.* alis subcinereis, *venis albidis* apud costam fuscis, pedibus rufis. Long.  $3\frac{1}{2}$ —4; alar. 7—8 lin.

Black. *Male*. Head and thorax clothed with black hairs. Wings grey, brownish along the costa; stigma dark brown; veins black towards the costa, the rest pale brown. Abdomen clothed with white hairs. *Tarsi reddish*. *Fem.* Wings greyish; stigma and veins towards the costa dark brown, *the other veins whitish*. Legs red.

Common. A vernal species. (E. I.)

8. **lanigerus**, Hoffm.; Meig. Zw. i. 317. 14 (1818); Hal.—*vernalis*, Meig.; Mcq.; Zett.—*laniger*, Meig. Zw. vi.; Mcq.; Loew. Niger; *Mas*, nigro-pilosus, alis subcinereis ad costam fuscis, abdomine albido-piloso, *tibiis tarsisque rufis*; *Fœm.* alis subcinereis ad costam obscurioribus, *venis pallide fuscis* apud costam obscurioribus, pedibus rufis. Long.  $2\frac{1}{2}$ —3; alar. 5—6 lin.

Black. *Male*. Head and thorax clothed with black hairs. Wings greyish, brown along the costa; stigma dark brown; veins towards the stigma black, the other veins pale brown. Abdomen clothed with whitish hairs. *Tibiæ and tarsi red*. *Fem.* Wings greyish, a little darker along the costa; stigma and veins towards the costa brown, *the other veins pale brown*. Halteres brown. Legs red; tarsi darker; trochanters and knees black.

Generally distributed. A vernal species. (E. S. I.)

9. **nigriventris**, Hal. E. M. i. 157 (1833); Locw; Zett.—*albipennis*, Meig.—*lacleipennis*, Zett. Niger; *Mas*, albido-pilosus, capite nigro-piloso, alis subcinerascentibus, *venis pallide fuscis* ad costam

creasing in length; fifth much longer than the fourth; unguis and onyehia distinct. *Male.* Head broad. Eyes very large, connected above. Abdomen obtuse at the tip. *Fem.* Head narrow. Eyes small, remote. Abdomen slightly acuminate.

This genus is nearly allied to *Bibio* in habit, structure, and economy.

1. **spinatus**, Müller, Faun. Fridr. 695; Zool. Dan. Prodr. 169. 1982 (1776).—*nigritus*, Oliv.—*forcipatus*, Latr.; Sehr.—*febrilis*, Meig. Klass.—*vulgaris*, Meig.; Meq.; Gim.; Loew.; Zett. Niger; *Mas, alis albis, apud costam pallide fuscis, venis albis apud costam nigris*; *Fœm. alis nigrantibus, apud marginem postieum einereis, apice sublimpidis.* Long.  $2\frac{1}{2}$ — $3\frac{1}{2}$ ; alar. 5—7 lin.

Blaek. *Male.* Wings white, slightly clouded with pale brown along the costa; stigma blackish; veins towards the costa black, the other veins white. *Fem.* Wings blackish, grey along the hind border, nearly limpid at the tips; stigma and veins black.

Generally distributed. (E. S. I.) “In profusion everywhere, most so on sand-hills. Appears in conservatories even during a severe frost in the middle of winter.”—Hal. MSS.

2. **femoratus**, Meig. Z. i. 307. 2 (1818); Meq.; Zett.; Gim. Nigra, *alis albis*, stigmata nigro-fuseo, *venis albis apud costam fuscescentibus*; *Fœm. femoribus rufis.* Long.  $2\frac{1}{2}$ —3; alar. 5—6 lin.

Black. Wings white; stigma blackish-brown; veins towards the costa brownish, the rest white. *Fem.* Femora and fore coxae red.

“Common on Umbelliferæ.”—Hal. MSS. (E. I.)

### Genus III. SCATOPSE.

**SCATOPSE**, Geoff. H. N. Ins. (1764); Schr.; Fab. S. A.; Meig.; Meq.; Loew; Zett. *Tipula* p., L.; F. E. S.; D. G. *Hirtea* p., F. Suppl. *Ceria*, Scop.

Corpus parvum aut minimum, elongatum, glabrum, nitidum. Caput rotundatum, thorace angustius. Oculi reniformes, margine antico pro antennarum insertione nonnihil excisi, non connexi. Ocelli tres. Palpi ocellati, uniarticulati. Antennæ 11-articulatæ, porrectæ, erasiusculæ, cylindricæ, subunioniformes, capite paullo longiores, articulo undecimo rotundato. Thorax eonvexus, ovatus. Scutellum parvum. Alæ longæ, nudæ, hyalinæ; venæ apud costam bene determinatae, in disco indistinctæ. Halteres distincti. Abdomen depresso, lineare aut obconicum, segmentis 6 vel 7 distinctis. Pedes simplices, nudi, inermes, subæquales. *Mas.* Abdomen basi subcontratum, apice obtusum. *Fœm.* Abdomen lineare, apice subacuminatum.

Body small, or very minute, long, narrow, smooth, shining. Head rounded, narrower than the thorax. Eyes reniform, remote, slightly excavated at the insertion of the antennæ. Ocelli three. Palpi very

short, hidden, apparently one-jointed. Antennæ eleven-jointed, porrect, cylindrical, rather stout, nearly moniliform, a little longer than the head, the eleventh joint rounded. Thorax convex, oval. Scutellum small. Wings long, bare, hyaline; veins very distinct towards the costa, indistinct in the disc of the wing; subcostal vein proceeding from near the base of the wing, varying in length; radial proceeding from the angle of the transverse vein, which bounds the præbrachial areolet, varying in length; subapical including the tip of the wing between its forks, which commence opposite the tip of the radial vein, with which its fore fork is connected by a slightly recurrent transverse vein; pobrazial vein nearly obsolete, as are also its two forks, the extero-medial and the subanal veins; anal and subaxillary veins distinct, the latter very undulating. Areolets twelve,—the subcostal and the radial, which are partly united, the cubital, the præbrachial, which is very small, the pobrazial, which is open and imperfect, three subapical, the extero-medial and the anal, which are imperfectly divided from the pobrazial, the axillary, and the subaxillary. Posterior margin slightly curved inward, but not angular near the base. Halteres distinct. Abdomen depressed, linear or oboconical, with six or seven distinct segments, longer than the thorax. Legs simple, bare, unarmed, nearly equal in size.

Larva long, fusiform, apod, with two short points at the sides of the prothorax and of the eight basal segments of the abdomen, which is terminated by two elongated divergent setæ. Feeds on decaying vegetable or animal substances.

The species may be grouped thus:—

- a.* Radial vein longer than two-thirds of the wing.
- b.* Subcostal vein less than one-third of the wing. Species 1, 2.
- b b.* Subcostal vein about one-third of the wing. Species 3.
- b b b.* Subcostal vein more than one-third of the wing. Species 4–7.
- a a.* Radial vein longer than half the wing. Species 8–12.
- a a a.* Radial vein half the length of the wing. Species 13.
- a a a a.* Radial vein one-third of the length of the wing. Species 14.

1. **notata**, L. F. S. 1773 (1761); Gmel.; Schr.; Latr.; Meig.; Meq.; Gim.; Zett.; Locw.—*nectaria*, L.; Gmel.—*decemnodia*, Scop.—*nigra*, Geoff.; Schr.; Latr.; Meig.; Meq.; Gim.—*latrinarum*, D. G.; Meig. Kl. Zw.; Oken.—*albipennis*, F.; Meig. Kl. Zw.—*punctata*, Meig.; Zett. I. L.; Gim.; Perris. Atra, nitens, alis limpidis, thoracis lateribus nonnunquam albo-vittatis, alis limpidis, venis albis apud costam nigris; *Mas*, metatarso postico abbreviato. Long. 1–1½; alar. 2½–3 lin.

Black, shining. Wings limpid; costal, subcostal, and radial veins black, the rest white; subcostal vein ending before one-third of the length of the wing; radial ending with the costal beyond two-thirds of the length.—Var.  $\beta$ . A white stripe on each side of the thorax.

Generally distributed; frequents flowers, walls, windows, and

10. **soluta**, Loew, Linn. Ent. i. 335. 8 (1846): *Nigra, alis limpidis, venis albis apud costam testaceis, vena radiali a costa remota, subapicalis ramo antico basi interrupto.* Long. 1; alar. 2 lin.

*Black.* Wings limpid; costal, subcostal, and radial veins testaceous, the rest white; subcostal ending at a little beyond one-third of the length of the wing; radial rather far from the border, ending at some distance beyond half the length.

Common. (E. I.)

11. **simplex**, n. *Nigra, alis subcinereis, venis albidis apud costam nigris.* Long.  $1\frac{1}{2}$ ; alar.  $1\frac{1}{2}$  lin.

*Black.* Wings slightly grey; costal, subcostal, and radial veins black, the other veins whitish; subcostal vein ending at about one-third of the length of the wing; radial ending with the eostal at some distance beyond half the length.

Rare. (E.)

12. **albitarsis**, Zett. Dipt. Seand. ix. 3408. 14 (1850). *Nigra, elongata, alis albis, venis albis apud eostam testaceis, tarsis albis.* Long.  $1\frac{1}{4}$ ; alar. 2 lin.

*Black.* Body rather long. Wings white; costal, subcostal, and radial veins testaceous, the rest white; subcostal vein ending at a little before half the length of the wing; radial ending at a little beyond half the length. Tarsi white.

Common. (E. I.)

13. **halterata**, Meig. Zw. vii. 55. 16 (1838); Loew. *Nigra, alis limpidis, venis albis apud costam nigricantibus.* Long.  $\frac{2}{3}$ ; alar.  $1\frac{1}{3}$  lin.

*Black.* Wings limpid; costal, subcostal and radial veins blackish, the other veins white; subcostal ending at a little beyond one-fourth of the length of the wing; radial ending with the costal at half the length.

Rare. (E.)

14. **brevicornis**, Meig. Zw. vi. 314. 11 (1830); Loew; Zett.—*septemnodia*, Schr. *Nigra, antennis brevissimis, alis albis, venis albis apud eostam nigrieantibus.* Long.  $\frac{1}{2}-\frac{2}{3}$ ; alar.  $\frac{2}{3}-\frac{3}{4}$  lin.

*Black.* Antennæ very short. Wings white; eostal, subeostal, and radial veins blackish, the rest white; subcostal ending at about one-fourth of the length of the wing; radial ending with the eostal at one-third of the length.

Common. (E. S. I.)

---

#### Genus IV ASPISTES.

ASPISTES, Hoffm.; Meig. Zw. i. 319 (1818); Meq.; Zell.; Loew; Zett.

Corpus minutum, oblongo-ovatum, glabriculum, nitidum. Caput ro-

tundatum, thorace angustius et humilius. Oculi remoti, integri. Ocelli tres. Palpi occulti. Antennæ 12-articulatæ ?, porrectæ, crassiusculæ, subcylindricæ, capitatae, capite paullo longiores. Thorax gibbus, disco antico macula scutelliformi subquadrato-ovali subtiliter punctulata. Scutellum transversum. Alæ magnæ, nudæ, hyalinæ. Halteres distincti. Abdomen 8-annulatum, latum, depresso. Pedes validiusculi, subpubescentes; antici coxis majoribus, femoribus crassis aut crassissimis subtus setulosis, tibiis intus spina longiuscula terminatis; tibiæ posteriores apice breviter calcaratæ.

Body very small, oblong-oval, shining, nearly smooth. Head round-ed, narrower and lower than the thorax. Eyes remote, entire. Ocelli three. Palpi hidden. Antennæ twelve-jointed ?, capitate, porrect, rather thick, nearly cylindrical, a little longer than the head. Thorax gibbous, with a subquadrate-oval, finely punctured, scutelliform spot on the disc in front. Scutellum transverse. Wings large, bare, hyaline; subcostal vein rudimentary; radial ending at much before half the length of the wing; cubital ending at much before two-thirds of the length; sub-apical proceeding from near the tip of the cubital, ending at the tip of the wing; subanal proceeding from the cubital before half its length; anal and subaxillary distinct, the latter forming an angle. Areolets seven,—the humeral, which is very short, the radial, the cubital, the subapical, the anal, the axillary, and the subaxillary. Posterior margin slightly curved inward near the base. Halteres distinct. Abdomen broad, depressed, with eight segments. Legs rather stout, slightly pubescent; fore coxae large; fore femora thick or very thick, slightly bristly beneath; fore tibiæ with a rather long apical spine; hinder tibiæ with short apical spurs.

This genus is nearly allied to *Scatopse* in habit and structure.

1. **pullus**, Hal. MSS. Nigra, nitens, thorace pubescente subnitido, alis limpidis, venis apud costam nigris, pedibus testaceis, tibiis posticis apice femoribusque nigris. Long.  $\frac{3}{4}$ ; alar.  $1\frac{1}{2}$  lin.

Black, shining. Thorax gibbous, pubescent, slightly shining. Wings limpid; costal, subcostal, and radial veins black; radial vein incrassated at its junction with the costal; the other veins colourless. Legs testaceous; femora black; hind tibiæ with black tips.

Rare. In Mr. Haliday's collection. (I.)

## FAMILY V SIMULIDÆ.

*Tipulariæ latipennes*, Meig.; Mcq. *Simuliites*, Newm. *Simulides*, Zett. *Simulinæ*, Rondani.

*Ocelli nulli. Mesothoracis scutum integrum. Vena costalis ante alæ apicem terminata. Tibiæ et metatarsi lata, compressa.*

*cinereo-tomentosa*, thorace maculis duabus anticis albis. Long.  $1\frac{1}{2}$ - $1\frac{3}{4}$ ; alar.  $3\frac{1}{2}$  lin.

Wings limpid; costal, radial, and cubital veins blackish, the rest white. Halteres luteous. Tibiae and hind tarsi white towards the base. *Male*. Deep black. Head white in front. Thorax with slightly gilded tomentum; sides white; an interrupted white band in front. *Fem.* Black, with cinereous tomentum. Thorax with a large white spot on each side in front.

Generally distributed. (E. S. I.)

2. **elegans**, Meig. Zw. i. 226. 9 (1818). Alis limpidis, venis albis apud costam nigricantibus, halteribus luteis, genubus albidis, tibiis anticis albis apice nigris; *Mas*, atra, thoracis fascia antice interrupta, macula dorsali lateribusque albis, abdominis lateribus albo-trimaculatis; *Fœm.* nigra, *cinereo-tomentosa*. Long.  $1\frac{1}{4}$ - $1\frac{1}{2}$ ; alar. 3 lin.

Wings limpid; costal, radial, and cubital veins blackish, the rest white. Halteres luteous. Knees whitish; fore tibiae white, black towards the tips. *Male*. Deep black. Thorax with an interrupted white band in front and with a white dorsal spot; sides white. Abdomen with three white spots on each side. *Fem.* Black, with grey tomentum.

Generally distributed. (E. S. I.)

3. **marginata**, Meg.; Meig. Zw. i. 293. 6 (1818). Alis limpidis, venis albis apud costam nigris; *Mas*, atra, thorace antice et inter alas ferrugineo-cinereo, halteribus piceis, abdomine basi subtusque ferrugineo-cinereo, femoribus tibiisque cinereis; *Fœm.* nigra, *corpo femoribus tibiisque cinereo-tomentosis*, halteribus fulvis. Long.  $1\frac{1}{2}$ - $1\frac{3}{4}$ ; alar.  $3\frac{1}{2}$  lin.

Wings limpid; costal, radial, and cubital veins black, the other veins white. *Male*. Deep black. Thorax with ferruginous-cinereous tomentum in front and between the wings. Halteres piceous. Abdomen with ferruginous-cinereous tomentum at the base and beneath. Femora and tibiae with cinereous tomentum. *Fem.* Black. *Body, femora, and tibiae with cinereous tomentum*. Halteres tawny.

Not rare. (E.)

4. **lineata**, Meig. Kl. Zw. i. 95. 2 (1804). *Fœm.* nigra, subcinereo-tomentosa, *thorace vittis quatuor canis*, alis limpidis apud costam fulvis, halteribus albidis. Long.  $1\frac{1}{4}$ ; alar. 3 lin.

*Fem.* Black, with grey tomentum. *Thorax with four hoary stripes*. Wings limpid; costal, radial, and cubital veins tawny, the other veins white. Halteres whitish.

Not common. (E.)

5. **fuscipes**, Zett. Fries, Monogr. Simul. 18. 6 (1829?); Meig. Zw. vi. 314. 12 (1830); Zett.—var. *pubiventris*, Zett. I. L. *Fœm.* nigra, *cano-tomentosa*, alis limpidis, venis albidis, apud costam nigris, halteribus albidis. Long.  $1\frac{1}{4}$ ; alar.  $3\frac{1}{4}$  lin.

*Fem.* *Body and legs black, with hoary tomentum.* Wings limpid;

costal, radial, and cubital veins black, the other veins white. Halteres whitish.

Not common. (E.)

### FAMILY VI. CHIRONOMIDÆ.

CHIRONOMIDÆ, Haliday, MSS. Brit. Dipt. i. 7. (1851). *Tipularia* *culiciformes* p., Meig.; Mcq.; Winn. *Culicites* p., Newm. *Tipulidæ* p., Leach; Steph. *Chironomii* p., Zett. *Chironominæ* p., Rond.

Ocelli nulli. Mesothoracis scutum integrum, absque sutura transversa. Alæ angustæ, margine postico aveniæ (membrana longius pubescente aut glaberrima); vena costalis apud alæ apicem terminata. Pedes sæpissime tenues, tibiis et tarsis gracilibus, subcylindricis.

Ocelli none. Scutum of the mesonotum undivided. Wings and halteres developed. Wings narrow, without veins along the posterior margin; costal vein ending near the tip of the wing. Legs generally attenuated; tibiæ and tarsi slender, nearly cylindrical.

These flies are usually called Midges; generally inhabit water or watery ground during their larva-state; and some species occur in innumerable multitudes, and their numbers must much contribute to remove or change to earth the decaying vegetable matter, which is their earliest food. The larvæ of a few species dwell beneath the bark of trees.

I am indebted to Mr. Haliday for the characters in the following grouping of the genera:—

- a.* Proboscis distinct, with (4-) jointed palpi. Metathorax produced over the base of the abdomen.
- b.* Mesosternum compressed, gibbous, descending as low as the ends of the posterior coxæ.
- c.* Wings oblong, with the anal angle more or less abrupt.
  - d.* Antennæ with twelve joints or more in the male, seven or eight in the female. 1. CHIRONOMUS.
  - d d.* Antennæ fifteen-jointed, plumose in the male, with the penultimate joint elongated. Pobrachial areolet closed externally. 2. TANYPUS.
  - c c.* Wings nearly spatulate, the anal margin being sloped without an angle. 3. CORYNONEURA.
- b b.* Metathorax short, descending. Posterior coxæ extending downwards beyond the convex mesosternum. 4. CERATOPOGON.
- a a.* Proboscis and palpi obsolete. Wings coriaceous. 9. CLUNIO.

#### Genus I. **CHIRONOMUS.**

CHIRONOMUS, Meig. Illig. Mag. (1801); Fabr.; Latr.; Curt.; Mcq.; Zett.; Westw.; Stæg.; Gim. *Tipula* p., L.; F. E. S.; D. G.; Schr. *Tanypus* p., Lam.

Corpus elongatum, mediocre, aut parvum, aut minimum, sæpiissime pubescent. Caput parvum, sessile. Oculi reniformes, remoti. Proboscis brevis. Palpi 4-articulati, incurvi, subcylindrici; articulus primus brevissimus; secundus et tertius æquales; quartus longior et gracilior. Antennæ porrectæ, filiformes. Thorax ovatus aut longiovatus, antice plus minusve productus. Scutellum mediocre. Alæ angustæ, elongatae, lanceolatae, deflexæ. Abdomen segmentis 8, gracile. Pedes antici plus minusve elongati. *Mas.* Antennæ plumosæ, 13-articulatæ. *Fæm.* Antennæ verticillato-pilosæ, 6-articulatæ.

Body of moderate size, or small, or very minute. Eyes reniform, broader beneath, separate in both sexes. Mouth not elongated. Palpi four-jointed, prominent, curved, pubescent, nearly cylindrical; first joint very short; second and third of moderate and equal length; fourth a little longer and more slender. Antennæ porrect, filiform, seated in a notch of the eye. Thorax oval or elongate-oval, higher than the head, more or less protuberant in front, very generally with three dark stripes. Scutellum of moderate size. Wings narrow, elongate, lanceolate, deflexed, slightly ciliated along the hind border, generally bare, pubescent in some species; mediastinal vein more than half the length of the wing, not extending to the border; subcostal ending at nearly three-fourths of the length; radial emerging from the præbrachial transverse veinlet, ending at beyond three-fourths of the length; cubital proceeding from the præbrachial transverse veinlet, ending at very little in front of the tip; subapical ending at very little behind the tip; subanal forming a fork of the præbrachial; anal complete; subaxillary obsolete. Areolets eleven,—the humeral, the subcostal, the mediastinal, the radial, the cubital, the præbrachial, the pectoral, which is not closed as in *Tanypus*, the subapical, one externo-medial, the anal, and the axillary. Posterior margin much excavated, and forming an acute angle at its base. Abdomen with eight segments, slender, more or less exceeding twice the length of the thorax. Legs more or less long and slender, bare or slightly pilose, unarmed; coxae of moderate size; unguis and onychia very small. Fore legs remote from the others, porrect, their tarsi more or less elongated.

*Male.* Antennæ thirteen-jointed, as long as the thorax, thickly plumeous, the hairs decreasing in length towards the tips; first joint short, cylindrical; second and following joints to the twelfth globose, extremely short; thirteenth filiform, slender, generally as long as the whole of the preceding joints. Wings a little shorter than the abdomen. Abdomen slender, somewhat attenuated; seventh segment flattened, slightly dilated hindward, emarginate at the tip; eighth smaller, oval, depressed, with four little apical appendages, which are curved, somewhat hairy, falcate or nearly filiform; fore tarsi often hairy. *Fem.* Antennæ six-jointed, about half the length of the thorax; second, third, fourth, and fifth oblong or elongate-pyriform, slightly verticillate-pilose; sixth slender, filiform, as long as the fourth and the fifth. Wings as long as the abdomen. Abdomen comparatively short and thick, sub-lanceolate or nearly cylindrical.

The species of this genus are very numerous, and there are probably many British kinds in addition to those here described. They may be often seen hovering in the air in immense swarms, particularly towards evening, and those with delicate colours do not usually appear till near sunset. Some of the species with short fore metatarsi run with great activity; the others are more slow in their movements.

"The larva of *C. plumosus* is abundant in stagnant water, and is named Blood-worm on account of its colour, form, and movements. The head has two ocelli-like points, and two biarticulate palpi. The first thoracic segment has two short pediform tentacles beneath. The anal segment is furnished with two large and four small oval appendages, and there is a pair of long fleshy filaments on each of the two preceding joints. The larva at the bottom of the water forms tortuous tubes, which are composed of particles of decayed leaves."

"The pupa is not enclosed in a case, but is of a greater specific gravity than the water, at the bottom of which it resides until within a few hours of the exclusion of the fly. It has the power of swimming, and by moving the tail alternately backwards and forwards can slowly raise itself to the top of the water. For the extrication of the imago it is necessary that it should remain quietly suspended at the surface; and moreover that the thorax, in which the opening for its exit is to be made, should be at least level with it, and this is precisely what takes place. As soon as it has reached the top it remains suspended there motionless, and its thorax is the highest part of the body, and level with the surface. The middle of the back of the thorax has the property of repelling water, apparently from being covered with some oily secretion. Hence, as soon as the pupa has once forced this part of its body above the surface, the water is seen to retreat from it on all sides, leaving an oval space in the disc, which is quite dry. Just previously to the exclusion of the fly, the dry part of the thorax is seen to split in the middle. The air enters, and forms a brilliant stratum, resembling quicksilver, between the body of the insect and its puparium; and the former, pushing forth its head and fore legs, rests the latter upon the water, and in a few seconds extricates itself wholly from its envelope. The pupa, for respiration, has on each side of the thorax a pencil, consisting of five hairs elegantly feathered, which, when they diverge, forms a beautiful star; its anus also is furnished with a fan-shaped pencil of diverging hairs."

"The grub of *C. stercorarius* inhabits horse-dung, and has a

fleshy leg on the under side of the first segment, which points towards the head, and which it has the power of lengthening or contracting. Its various serpentine contortions also assist it in moving. When removed from the substance which constitutes its food, it is enabled to regain it by leaping. Lying horizontally, it brings the anus near the head, regulating the distance by the length of the leap it means to take; when, fixing it firmly, and then suddenly resuming a rectilinear position, it is carried through the air sometimes to the distance of two or three inches. It appears to have the power of flattening the anal extremity, and even of rendering it concave, by means of which it may probably act as a sucker, and so be more firmly fixable."

This genus may be divided into four principal groups:—

- \* Præbrahial areolet open.
  - † Wings deflected. Antennæ of the male with thirteen joints, of the female with seven joints.
    - ‡ Antennæ of the male feathered. Group 1.
    - ‡‡ Antennæ of the male with few hairs. Group 2.
  - †† Wings ineumbent. Antennæ of the male twelve-jointed, feathered; of the female seven-jointed. Group 3.
- \*\* Præbrahial areolet closed externally. Group 4.

The species of the first group may be arranged in the following sections:—

- A.* Fore metatarsus longer than the fore tibia.
  - a.* Fore metatarsus twice the length of the fore metatibia.
    - b.* Wings not spotted.
      - c.* Thorax black or grey. Species 1, 2.
      - c c.* Thorax green, with three black stripes. Species 3–5.
      - c c c.* Thorax green, with three testaceous stripes. Species 6–9.
      - c c c c.* Thorax testaceous or green, not striped. Species 10, 11.
    - b b.* Wings spotted. Species 12.
  - a a.* Fore metatarsus longer than the fore tibia by three-fourths.
    - b.* Thorax black. Species 13–15.
    - b b.* Thorax green, with three black or brown stripes. Species 16–20.
    - b b b.* Thorax green, with three testaceous stripes. Species 21–24.
  - a a a.* Fore metatarsus longer than the fore tibia by two-thirds.
    - b.* Wings not spotted.
      - c.* Thorax black, or grey. Species 25, 26.
      - c c.* Thorax pale, with three black or brown stripes. Species 27–32.
      - c c c.* Thorax pale, with three luteous stripes.
        - d.* Abdomen with black bands. Species 33.
        - d d.* Abdomen without bands. Species 34–40.
      - c c c c.* Thorax not striped. Species 41, 42.

- b b.* Wings spotted. Species 43.
- a a a a.* Fore metatarsus longer than the fore tibia by one-half.
- b.* Wings banded or spotted. Species 44, 45.
- b b.* Wings not banded or spotted.
- c.* Thorax black.—*Note.* In the female of *C. pedellus* the thorax is green, with three black stripes.
- d.* Abdomen black.
- e.* Tarsi white towards the base. Species 46.
- e e.* Tarsi not white towards the base. Species 47–50.
- d d.* Abdomen green. Species 51, 52.
- c c.* Body blackish-green. Species 53.
- c c c.* Thorax brown or grey, with three black stripes. Species 54, 55.
- c c c c.* Thorax pale, with three black stripes. Species 56–61.
- c c c c c.* Thorax pale, with three brown stripes. Species 62–64.
- c c c c c c.* Thorax pale, with three pale stripes. Species 65–73.
- c c c c c c c.* Thorax pale, not striped. Species 74.
- a a a a a.* Fore metatarsus longer than the fore tibia by one-quarter.
- b.* Wings not spotted.
- c.* Thorax black. Species 75–77.
- c c.* Thorax piceous. Species 78.
- c c c.* Thorax grey, with three black stripes. Species 79–81.
- c c c c.* Thorax pale.
- d.* Thorax with three black stripes. Species 82, 83.
- d d.* Thorax with three brown stripes. Species 84, 85.
- d d d.* Thorax with three pale stripes. Species 86–88.
- b b.* Wings spotted. Species 89.
- a a a a a a.* Fore metatarsus longer than the fore tibia by one-fifth.
- b.* Thorax black. Species 90–94.
- b b.* Thorax hoary, with three black stripes. Species 95.
- b b b.* Thorax pale.
- c.* Thorax with three black or brown stripes. Species 96–103.
- a a a a a a a.* Fore metatarsus longer than the fore tibia by one-sixth. Species 104.
- A A.* Fore metatarsus and fore tibia of equal length.
- a.* Thorax black. Species 105–107.
- a a.* Thorax pale, with three darker stripes. Species 108–112.
- A A A.* Fore metatarsus shorter than the fore tibia.
- a.* Fore tibia longer than the fore metatarsus by one-seventh. Species 113.
- a a.* Fore tibia longer than the fore metatarsus by one-sixth. Species 114–117.
- a a a.* Fore tibia longer than the fore metatarsus by one-fifth. Species 118.
- a a a a.* Fore tibia longer than the fore metatarsus by one-fourth.
- b.* Thorax black. Species 119–125.
- b b.* Thorax pale, with three black stripes. Species 126–131.

- b b b.* Thorax pale, with three darker stripes. Species 132–136.  
*b b b b.* Thorax pale, not striped. Species 137.  
*a a a a a.* Fore tibia longer than the fore metatarsus by one-half.  
*b.* Thorax not prolonged in front.  
*c.* Thorax black or grey, not striped. Species 138–147.  
*c c.* Thorax hoary, with three black stripes. Species 148, 149.  
*c c c.* Thorax pale, with three black or brown stripes. Species 150–153.  
*c c c c.* Thorax pale, not striped. Species 154.  
*b b.* Thorax prolonged in front. Species 155.  
*a a a a a a.* Fore tibia longer than the fore metatarsus by two-thirds.  
*b.* Body black. Species 156–162.  
*b b.* Thorax hoary, with three black stripes. Species 163–167.  
*b b b.* Thorax grey, with three black stripes. Species 168.  
*b b b b.* Thorax with pale stripes; abdomen with pale bands. Species 169–171.  
*b b b b b.* Thorax pale, with three black or brown stripes. Species 172–174.  
*a a a a a a a.* Fore tibia longer than the fore metatarsus by three-fourths.  
*b.* Thorax black, or hoary. Species 175–178.  
*b b.* Thorax pale. Species 179.  
*a a a a a a a a.* Fore tibia twice the length of the fore metatarsus.  
*b.* Body black, or grey. Species 180–185.  
*b b.* Thorax pale, with darker stripes. Species 186–188.

1. **dissidens**, n. *Mas*, niger, thorace subcinereo vittis tribus nigris, alis limpidis, venis subfuscis, halteribus *pedibusque testaceis, femoribus, tibiis posterioribus apice, tibiis anticis tarsisque nigricantibus*. Long. 2; alar. 4 lin.

*Male.* Black. Antennæ with brown plumes. Thorax slightly grey, with three black stripes. Wings limpid, with a blackish mark at the base; veins pale brown; discal transverse veinlet rather darker than the rest. Halteres testaceous. Legs testaceous; femora, tips of the tibiæ, tarsi, and fore tibiæ blackish.

Not common. (E.)

2. **punctipes?** Wied. Zool. Mag. i. 1. 65 (1816); Meig.—*bicolor?* Meig. Zw. vii. 7. 134 (1838). *Mas et Fœm.* niger, alis albo-limpidis, venis albicantibus, halteribus abdomineque viridibus, *pedibus pallide testaceis, tibiis apice paullo obscurioribus*. Long.  $1\frac{3}{4}$ –2; alar. 3– $3\frac{1}{2}$  lin.

*Male and Fem.* Black. Wings limpid-white; veins whitish. Halteres and abdomen green. Legs pale testaceous; tips of the tibiæ rather darker. *Male.* Antennæ with brown plumes.

Abundant in September. (E. S. I.)

3. **pusillus**, L. S. N. ii. 975 (1767); F.; Gmel.; Meig.; Mcq.; Zett.; Gim.; Stæg. *Mas et Fœm.* *viridis*, thorace vittis tribus nigris

nonnunquam testaceo, alis limpidis, *venis* pedibusque *pallide testaceis*, tibiis apice femoribusque paullo obseurioribus. Long.  $1\frac{1}{2}$ - $1\frac{3}{4}$ ; alar.  $2\frac{1}{2}$ -3 lin.

*Male and Fem. Green.* Thorax with three black stripes. *Wings* limpid; *veins pale testaceous.* Legs pale testaceous; femora and tips of the tibiae rather darker.—Var.  $\beta$ . Thorax testaceous, with three black stripes. *Male.* Antennæ with brown plumes.

Apparently allied to *C. prasinatus*, Stæg. Common. (E.)

4. **viridulus**, L. S. N. ii. 975 (1767); F.; Gmel.; Meig.; Meq.; Zett.; Gim.; Stæg. *Mas*, viridis, thorace vittis tribus nigricantibus, alis limpidis, *venis albidis apud costam nigricantibus*, halteribus albidis, pedibus testaceis. Long.  $1\frac{1}{4}$ ; alar. 2 lin.

*Male. Green.* Palpi and antennæ black. Thorax with three blackish stripes. *Wings* limpid; *costal, radial, and cubital veins blackish, the rest whitish.* Halteres whitish. Abdomen pubescent. Legs testaceous, the four posterior very pubescent. *Male.* Antennæ with brown plumes.

Not rare. (E.)

5. **tenuis?** Meq. H. N. D. i. 52. 19 (1834); Meig. *Mas, niger, thorace cano-viridi vittis tribus latis nigro-cinereis*, alis limpidis, *venis* pedibusque testaceis, halteribus albidis, tibiis apice fuscis. Long.  $1\frac{3}{4}$ ; alar. 3 lin.

*Black.* Thorax hoary green, with three broad greyish-black stripes. Wings limpid; veins testaceous. Halteres whitish. Legs testaceous; tips of the tibiae brown. *Male.* Antennæ with testaceous plumes.

Not common. (E.)

6. **ejuncidus**, n. *Mas*, viridis, thorace vittis tribus testaceis, alis albo-limpidis, *venis albidis*, halteribus albis, *abdomine fusco valde pubescente*, segmentorum marginibus albis, pedibus albido-testaceis. Long.  $1\frac{1}{4}$ ; alar. 2 lin.

*Male. Green.* Antennæ with testaceous plumes. Thorax with three testaceous stripes. Wings limpid-white; veins whitish. Halteres white. *Abdomen brown, very pubescent*, with a white band on the hind border of each segment. Legs whitish-testaceous.

Not common. (E.)

7. **brevitibialis?** Zett. Dipt. Seand. ix. 3537. 59 (1850). *Mas, flavidoviridis, thorace vittis tribus testaceis*, alis albo-limpidis, *venis* halteribusque albis, *abdomine obscure viridi vix pubescente*, pedibus pallide viridibus, tarsis apice nigris. Long.  $1\frac{3}{4}$ ; alar. 3 lin.

*Male. Yellowish-green.* Palpi and antennæ testaceous, the latter with brown plumes. *Thorax with three testaceous stripes.* Wings limpid-white; veins and halteres white. *Abdomen dark dull green, hardly pubescent.* Legs pale green; tarsi black towards the tips.

Not common. (E.)

8. **rufovittatus?** Stæg. Dipt. Dan. 570. 39 (1840); Zett. *Mas,*

*prasinus*, *thorace vittis tribus luteis*, alis albo-limpidis, venis halteribusque albis, *abdomine pallide viridi vix pubescente*, pedibus pallide testaceis. Long.  $1\frac{1}{4}$ - $1\frac{3}{4}$ ; alar. 2-3 lin.

*Male. Grass-green.* Antennæ with testaceous plumes. *Thorax with three luteous stripes.* Wings limpid-white; veins and halteres white. *Abdomen pale green, hardly pubescent.* Legs pale testaceous.

Not rare. (E.)

9. **eminulus**, n. *Fœm. pallide viridis, thorace vittis tribus testaceis*, alis limpidis, venis halteribusque albis, *abdomine vix pubescente*, pedibus albido-testaceis. Long.  $1-1\frac{1}{2}$ ; alar. 2-3 lin.

*Fem. Pale green.* *Thorax with three testaceous stripes.* Wings limpid; veins and halteres white. *Abdomen hardly pubescent.* Legs whitish testaceous.

Not rare. (E.)

10. **ictericus?** Meig. Zw. vi. 253. 103 (1830); Stæg.; Zett. *Fœm. testaceus*, *alis pubescensibus fere limpidis*, venis halteribusque albidis, pedibus pallide testaceis. Long. 1; alar. 2 lin.

*Fem. Testaceous.* *Wings pubescent, nearly limpid;* veins and halteres whitish. Legs pale testaceous.

Not common. (E.)

11. **futilis**, n. *Mas, prasinus, alis limpidis*, venis albidis apud costam pallide testaceis, halteribus pedibusque pallide viridibus, tarsis testaceis. Long.  $1\frac{3}{4}$ ; alar. 3 lin.

*Male. Grass-green.* *Wings limpid;* costal, radial, and cubital veins pale testaceous, the rest whitish. Halteres pale green. Legs pale green; tarsi testaceous.

Not common. (E.)

12. **scalænus**, Schr. Fn. Boic. iii. 2324 (1798); Meig.; Mcq.; Stæg.; Zett. *Fœm. fuscus*, alis limpidis cinereo-trimaculatis, venis halteribusque albidis, pedibus pallide testaceis. Long.  $\frac{3}{4}$ -1; alar. 2 lin.

*Fem. Brown.* Wings limpid-white, with three grey spots, the first near the fore border and beyond the middle; the second and third near the hind border, the second before the middle, the third behind the first; veins and halteres whitish. Legs pale testaceous.

Rare. In the British Museum. (E.)

13. **glabrigollis?** Meig. Zw. vi. 248. 89 (1830); Stæg.; Zett.—Var.? *Mas, ater, alis lacteis*, venis albis, halteribus albidis, *abdomine nigro-viridi*, pedibus nigricantibus, tibiis tarsisque posterioribus pallide testaceis. Long.  $1\frac{1}{2}$ ; alar.  $2\frac{1}{2}$  lin.

Var.? *Male. Deep black.* *Wings milky-white;* veins white. Halteres whitish. Abdomen greenish-black. Legs blackish; posterior tibiae and tarsi pale testaceous.

Not common. (E.)

14. **notescens**, n. *Mas, niger, alis subcinereis, venis halteribusque*

*testaceis*, pedibus obseure testaceis pubescentibus, femoribus fuscescentibus. Long.  $2\frac{1}{4}$ ; alar. 4 lin.

*Male.* Blaek. *Wings slightly greyish; veins and halteres testaceous.* Legs dull testaceous, pubescent; femora brownish.

Not rare. (E.)

15. **flavimanus?** Meig. Zw. vi. 246. 80 (1830).—Var. ? *Fœm.* nigro-cinereus, *alis subcinereis, venis testaceis apud costam fuscis, halteribus testaceis, pedibus obseure testaceis, tibiis tarsisque antieis femoribusque posterioribus nigrieantibus.* Long. 2; alar. 4 lin.

*Fem.* Greyish-black. *Wings slightly greyish; costal, radial, and cubital veins and discal transverse veinlet brown, the rest testaceous.* Halteres testaceous. Legs dark testaceous, rather stout; femora, fore tibiæ, and fore tarsi blackish; fore femora testaceous, blackish towards the tips.

Not common. (E.)

16. **apriliinus?** Hoffm.; Meig. Zw. vi. 245. 78 (1830). *Mas et Fœm.* cano-viridis, thorace vittis tribus nigris, alis limpidis, venis albidiis apud eostam fuseis, halteribus albis, *abdominis segmentorum marginibus posticis canis*, pedibus testaceis, femoribus, tibiis et tarsorum arti-eulis apiee fuseis. Long.  $2\frac{1}{2}$ ; alar.  $4\frac{1}{2}$  lin.

Green, with a hoary tinge. Thorax with three black stripes, the middle one double. Wings limpid; costal, radial, and cubital veins and discal transverse veinlet brown, the rest whitish. Halteres white. *Abdomen black, with a hoary band on the hind border of each segment.* Legs testaceous; tips of the femora, of the tibiæ, and of the joints of the tarsi brown. *Male.* Antennæ with brown plumes.

Not common. (E.)

17. **flabellatus**, Meig. Zw. i. 51. 70 (1818). *Fœm.* nigro-fuseus, thorace testaceo, vittis tribus latis nigris, *alis subcinereis, venis testaceis apud eostam fuseescentibus, halteribus albis, pedibus obseure testaceis.* Long. 2; alar. 4 lin.

*Fem.* Brownish-black. Thorax testaceous, with three broad black stripes. *Wings greyish; costal, radial, and cubital veins brownish, the rest testaceous.* Halteres white. Legs dark testaceous. *Male.* Antennæ with brown plumes.

Not rare. (E.)

18. **objectans**, n. *Mas, viridis, thorace vittis tribus fuscis, alis limpidis, venis albidiis apud costam testaceis, halteribus albis, pedibus testaceis, senioribus tibiisque apiee tarsisque fuseis.* Long.  $2\frac{1}{2}$ ; alar.  $3\frac{1}{2}$  lin.

*Male.* Green. *Thorax with three brown stripes. Wings limpid; costal, radial, and cubital veins testaceous, the rest whitish.* Halteres white. Legs testaceous; tarsi and tips of the femora and of the tibiæ brown. *Male.* Antennæ with brown plumes.

Not common. (E.)

19. **prasinatus?** Stæg. Dipt. Dan. 568. 26 (1840); Zett. *Mas, viridis, thorace vittis tribus nigris, alis limpidis, venis albidis apud costam testaceis, halteribus albis, pedibus pallide testaccis.* Long.  $1\frac{1}{2}$ ; alar.  $2\frac{1}{2}$  lin.

*Male.* Green. Antennæ with blackish plumes. *Thorax with three black stripes. Wings limpid; costal, radial, and cubital veins testaceous, the rest whitish.* Halteres white. Legs pale testaceous.

Not common. (E.)

20. **pusio?** Meig. Zv. vi. 256. 117 (1830). *Mas, obscure viridis, thorace vittis tribus nigris, alis limpidis, venis pallide testaceis, halteribus pallide viridibus, pedibus pallide testaceo-viridibus.* Long.  $1\frac{3}{4}$ ; alar. 3 lin.

*Male.* Dark green. *Thorax with three black stripes. Wings limpid; veins pale testaceous.* Halteres pale green. Legs pale dull testaceous-green.

Not common. (E.)

21. **longipes?** Stæg. Dipt. Dan. 570. 38 (1840); Zett. *Fœm. viridis, thorace vittis tribus testaceis, alis albido-limpidis, venis halteribusque albidis, illis apud costam fuscescentibus, abdomine fusco, segmentorum marginibus posticis subcanis, pedibus testaceis, tarsis fuscescentibus.* Long.  $2\frac{1}{2}$ ; alar. 4 lin.

Var.? *Fœm.* Green. Thorax with three testaceous stripes. *Wings* whitish, limpid; *costal, radial, and cubital veins,* and *discal transverse veinlet brownish,* the rest whitish. Halteres whitish. Abdomen pubescent, dark brown; hind borders of the segments slightly hoary. Legs testaceous; tarsi brownish.

Not common. (E.)

22. **perlevis,** n. *Fœm. viridis, thorace vittis tribus testaceis, alis subcinereis, venis albidis apud costam testaceis, halteribus albis, abdome fuso, pedibus pallide testaceis.* Long. 1; alar. 2 lin.

*Fœm.* Green. Thorax with three testaceous stripes. *Wings greyish; costal, radial, and cubital veins testaceous,* the rest whitish. Halteres white. Abdomen brown. Legs pale testaceous.

Not common. (E.)

23. **viridis,** Fries, MSS.; Mcq.; H. N. D. i. 52. 21 (1834); Meig.; Stæg.; Zett. *Mas et Fœm. viridis, thorace vittis tribus testaceis, alis limpidis, venis albidis apud costam testaceis, halteribus albis, pedibus pallide testaccis, tibiis et tarsorum articulis apice nigricantibus.* Long.  $1\frac{1}{2}$ -2; alar. 3-4 lin.

*Male and Fœm.* Green. Thorax with three testaceous stripes. *Wings limpid; costal, radial, and cubital veins testaceous,* the rest whitish. Halteres white. Legs pale testaceous; tips of the tibiæ and of the joints of the tarsi blackish. *Male.* Antennæ with brown plumes.

Generally distributed. (E. S. I.)

24. **nervosus?** Stæg. Dipt. Dan. 567. 25 (1840); Zett. *Fœm.*

pallide viridis, thorace vittis tribus latissimis testaceis, alis sublimpidis, venis pallide testaceis, halteribus pallide viridibus, abdomine prasino, pedibus testaceis, femoribus tibiisque posterioribus pallide viridibus. Long.  $1\frac{1}{2}$ ; alar. 3 lin.

*Fem.* Pale green. Thorax with three very broad testaceous stripes. Pectus testaceous. *Wings nearly limpid; veins pale testaceous.* Halteres pale green. Abdomen grass-green. Legs testaceous; posterior femora and posterior tibiae pale green.

Not common. (E.)

25. **præcox**, Wied.; Meig. Zw. i. 49. 64 (1818). *Mas et Fœm. niger, thorace cinereo vittis tribus nigris, alis pubescensibus subcinereis, venis albidis apud costam testaceis, halteribus albis, pedibus fuscis aut testaceis, femoribus tibiisque apice tarsisque nigris.* Long.  $2\frac{1}{2}$ -3; alar. 4- $4\frac{1}{2}$  lin.

*Male and Fem. Black.* Thorax grey, with three black dorsal stripes. Wings pubescent, slightly greyish; costal, radial, and cubital veins testaceous, the rest whitish. Halteres white. Abdomen pubescent. Legs brown or testaceous, long, slender, minutely pubescent; tarsi and tips of the femora and of the tibiae black. *Male.* Antennæ with black plumes.

Common. Appears in April.

26. **chloris?** Meig. Zw. i. 28. 17 (1818); Mcq.; Stæg. *Fœm. niger, thorace cano-testaceo vittis tribus nigris, alis albo-limpidis, venis albidis apud costam testaceis, halteribus albidis, segmentorum abdominalium marginibus posticis canis, pedibus nigricantibus, tibiis posterioribus femoribusque testaceis, apice nigris.* Long.  $3\frac{1}{2}$ ; alar. 6 lin.

*Fem. Black.* Thorax hoary-testaceous, with three black stripes, the middle one double. Pectus hoary. Wings limpid-white; costal, radial, and cubital veins testaceous, the rest white. Halteres whitish. Hind borders of the abdominal segments hoary. Legs blackish; femora and posterior tibiae testaceous, with black tips.

Not common. (E.)

27. **sulphuricollis?** Meig. Zw. vi. 246. 79 (1830). *Fœm. niger, thorace fulvo vittis tribus nigris, alis limpidis, venis albidis apud costam testaceis, halteribus testaceis apice nigris, pedibus testaceis, femoribus tibiisque et tarsorum articulis apice nigricantibus.* Long. 2; alar. 4 lin.

*Fem. Black.* Thorax tawny, with three black stripes. Wings limpid; costal, radial, and cubital veins testaceous, the rest whitish. Halteres testaceous, with black tips. Legs testaceous; tips of the femora, of the tibiae, and of the joints of the tarsi, blackish.

Rare. In Mr. Saunders' collection. (E.)

28. **nigroviridis?** Mcq. H. N. D. i. 51. 18 (1834); Meig.; Gim.; Stæg.; Zett. *Mas et Fœm. viridis, thorace vittis tribus fuscis, alis limpidis, venis albidis apud costam testaceis, venula discali fusca, halteribus albidis, abdomine fasciis latis fuscis, pedibus pallide viridibus, femoribus*

tibiisque neenon tarsorum articulis apice nigris. Long. 3–3½; alar. 4–4½ lin.

*Male and Fem. Green.* Thorax with three brown stripes; metathorax brown. Wings limpid; costal, radial, and cubital veins pale testaceous, the rest white; discal transverse veinlet brown. Halteres whitish. Abdominal segments with broad brown bands. Legs pale green; tips of the femora, of the tibiæ, and of the joints of the tarsi black. *Male.* Antennæ with brown plumes.

Not rare. (E.)

29. **debilis?** Meig. Zw. vi. 255. 113 (1830). *Mas et Fœm. testaceus, thorace vittis tribus latis fuscis, alis subcinereis, venis fuscis, halteribus albis, abdomine viridi, segmentorum apicem versus marginibus posticis nigris, pedibus sordide testaceis.* Long. 2; alar. 4 lin.

*Male and Fem. Testaceous.* Palpi and antennæ black. Thorax with three broad brown stripes. Wings greyish, pubescent; veins brown. Halteres white. Abdomen green; hind borders of the segments towards the tip black. Legs dingy testaceous, long, slender, pubescent.

Not rare. (E.)

30. **vernus?** Meig. Zw. i. 49. 66 (1818); Mcq.; Gim.; Stæg.; Zett. *Mas et Fœm. niger, thorace testaceo vittis tribus nigricantibus, alis subcinereis pubescentibus, venis albidis apud costam subfuscis, halteribus albis, abdomine fusco, pedibus sordide testaceis, tibiis tarsisque apice nigris.* Long. 2; alar. 4 lin.

*Male and Fem. Black.* Thorax testaceous, with three blackish stripes. Wings slightly greyish, pubescent; costal, radial, and cubital veins pale brownish, the rest whitish. Halteres white. Abdomen dark brown, pubescent. Legs dingy testaceous, very pubescent, long, slender; tips of the tibiæ and of the tarsi black. *Male.* Antennæ with brown plumes.

Not rare. (E.)

31. **lividus?** Meig. Zw. vi. 246. 82 (1830). *Mas et Fœm. viridis, thorace vittis tribus nitidis nigricantibus, alis albo-limpidis, venis halteribus albis, abdominis apice nigro, pedibus pallide viridibus, femoribus tibiis tarsisque apice nigris.* Long. 2½–3; alar. 4–5 lin.

*Male and Fem. Green.* Thorax with three blackish shining stripes. Wings limpid-white; veins and halteres white. Abdomen black towards the tip. Legs pale green, long, slender; tips of the femora, of the tibiæ, and of the tarsi black. *Male.* Plumes of the antennæ brown, whitish towards the base and towards the tips.

Rare. In the British Museum. (E.)

32. **prasinus,** Meig. Zw. i. 22. 4 (1818); Mcq.; Gim.—*intermedius?* Stæg.; Zett. *Mas et Fœm. viridis, thorace vittis tribus ferrugineis, alis albo-limpidis, venis albis apud costam testaceis, abdominis segmentis nigro-fasciatatis, pedibus viridibus, tibiis tarsisque apice nigris.* Long. 2½–4; alar. 4–6 lin.

Green. Thorax with three ferruginous stripes. Wings limpid-white,

with a distinct black discal dot; costal, radial, and cubital veins testaceous, the rest white. Abdomen with a black band on each segment; these bands are not, or hardly, apparent in immature specimens. Legs green; tips of the tibiae black; tarsi testaceous, their joints with black tips. *Male.* Antennæ with brown plumes.

Generally distributed. (E. S. I.)

33. **viridanus?** Mcq. H. N. D. i. 52. 22 (1834); Meig. *Form. viridis, thorace vittis tribus luteis, alis limpidis, venis albidis apud costam testaceis, abdomine prasino, halteribus pedibusque pallide viridibus, tibiis et tarsorum articulis apice nigricantibus.* Long.  $1\frac{1}{2}$ -2; alar. 3-4 lin.

*Fem. Green.* Thorax with three luteous stripes. Wings limpid; costal, radial, and cubital veins testaceous, the rest whitish. Halteres pale green. Abdomen grass-green. Legs pale green; tips of the tibiae and of the joints of the tarsi blackish.

Not rare. (E.)

34. **discessus,** n. *Mas et Fœm. pallide viridis, thorace vittis tribus luteis, alis limpidis, venis albidis apud costam testaceis, pedibus testaceis, tibiis et tarsorum articulis apice tarisque anticis totis nigricantibus.* Long.  $2\frac{1}{2}$ ; alar. 4 lin.

*Male and Fem. Pale green.* Thorax with three luteous stripes. Wings limpid; costal, radial, and cubital veins pale testaceous, the rest whitish. Halteres pale green. Legs testaceous; tips of the tibiae, and of the joints of the tarsi, and the whole of the fore tarsi, blackish.

Not common. (E.)

35. **parilis,** n. *Mas et Fœm. viridis, thorace vittis tribus pallide testaceis, alis pubescentibus subcinereis, venis albidis apud costam testaceis, halteribus albis, tibiis et tarsorum articulis apice tarisque anticis totis nigricantibus.* Long. 2-3; alar. 3-4 lin.

*Male and Fem. Green.* Thorax with three pale testaceous stripes. Wings pubescent, slightly greyish; costal, cubital, and radial veins testaceous, the rest whitish. Halteres white. Legs pale green; tips of the tibiae, and of the joints of the tarsi, and the whole of the fore tarsi, blackish. *Male.* Antennæ with testaceous plumes.—Var.  $\beta$ . Pale green. Stripes of the thorax almost obsolete.

Common. (E.)

36. **mancus,** n. *Mas, viridis, thorace vittis tribus luteis, alis limpidis, venis albidis, pedibus testaceis, femoribus, tibiis et tarsorum articulis apice nigricantibus.* Long.  $1\frac{3}{4}$ ; alar. 3 lin.

*Male. Green.* Antennæ with brown plumes. Thorax with three luteous stripes. Wings limpid; veins whitish. Halteres pale green. Legs pale testaceous; tips of the femora, of the tibiae, and of the joints of the tarsi, blackish.

Not common. (E.)

37. **convictus,** n. *Mas et Fœm. pallide viridis, validiusculus, tho-*  
VOL. IV. X

*race vittis tribus testaceis, alis albo-limpidis, venis halteribusque albidis, tibiis et tarsorum artieulis apice nigricantibus.* Long. 2; alar.  $3\frac{1}{2}$  lin.

*Male and Fem. Pale green, rather stout. Thorax with three testaceous stripes. Wings limpid-white; veins and halteres whitish. Legs pale green; tips of the tibiae and of the joints of the tarsi blackish.*

Not common. (E.)

38. **testaceus?** Meq. D. N. i. 198. 16 (1826); Meig.; Stæg.; Zett.—Var.? *Fœm. pallide testaceus, thorace vittis tribus obscurioribus, alis perlividis, venis halteribusque albis, femoribus tibiis tarsisque apice obscure testaceis.* Long.  $1\frac{1}{2}$ ; alar. 3 lin.

*Var.? Fem. Pale testaceous. Thorax with three slightly darker stripes. Wings quite limpid; veins and halteres white. Legs very pale testaceous; tips of the femora, of the tibiae, and of the tarsi, darker.*

Not common. (E.)

39. **rufovittatus?** Stæg. Dipt. Dan. 570. 39 (1840); Zett.—Var.? *Fœm. pallide testaceus, thorace vittis tribus paullo obscurioribus, alis sublimpidis, venis pallide testaceis, segmentorum abdominalium marginibus posticis albidis.* Long.  $1\frac{1}{2}$ ; alar. 3 lin.

*Var.? Fem. Pale testaceous. Thorax with three indistinct slightly darker stripes. Wings nearly limpid; veins pale testaceous. Hind borders of the abdominal segments whitish.*

Not common. (E.)

40. **modicellus**, n. *Fœm. pallide testaceus, alis albo-limpidis, halteribus pedibusque albis, abdomine viridi.* Long. 1; alar. 2 lin.

*Fem. Pale testaceous. Wings limpid-white. Halteres and legs white. Abdomen pale green.*

Not common. (E.)

41. **affinis**, Steph. MSS.—*pallidulus*, var.? Meig. *Mas et Fœm. pallide luteus, alis limpidis pubescensibus, venis pallide testaceis, halteribus albis, abdomine viridi, pedibus testaceis.* Long.  $1\frac{1}{2}$ — $1\frac{3}{4}$ ; alar. 3 lin.

*Pale luteous. Wings limpid, pubescent; veins pale testaceous. Halteres white. Abdomen pale green. Legs testaceous, long, slender. Male. Antennæ with testaceous plumes. Abdomen luteous towards the tip.*

Rare. In the British Museum. (E.)

42. **nubeculosus**, Meig. Zw. i. 32. 37 (1818); Meq.; Gim.; Stæg.; Zett. *Mas et Fœm. testaceus, thorace vittis tribus piceis, alis albo-limpidis, venis albis einereo-limbatis, abdomine nigro, segmentorum marginibus posticis albidis.* Long.  $2\frac{1}{2}$ —3; alar.  $3\frac{1}{2}$ —4 lin.

*Male and Fem. Testaceous. Palpi and antennæ black. Thorax with three piceous stripes. Wings limpid-white, with grey stripes along the veins, or grey, with the discs of the areolets limpid-white; eostal, radial, and cubital veins whitish, the rest white. Halteres whitish. Ab-*

domen black, pubescent, with a whitish band on the hind border of each segment. Legs testaceous, long, slender.

Not rare. (E.)

43. **gibbus**, F. E. S. iv. 245. 54 (1792); Panz.; Latr.; Meig.; Mcq.; Zett.—*flexilis*? L.; Geoff.; F.; Mcig. *Fœm.* pallide viridis, thorace vittis tribus luteis, *alis* albo-limpidis *fascia lata cinerea*, abdomine apicem versus nigricante, pedibus albidis, femoribus ex parte tibiisque posticis fuscis. Long.  $2\frac{1}{2}$ ; alar. 5 lin.

*Fem.* Pale green. Palpi blackish towards the tips. Thorax with three luteous stripes. *Wings* limpid-white, grey at the base, and *with a broad grey band*; veins whitish, brown in the band. Halteres white. Abdomen blackish towards the tip. Legs whitish, long, slender; femora partly brown; hind tibiae brown.

Rare. In the British Museum.

44. **maculipennis**, Meig. Zw. i. 38. 38 (1818); Gim. *Mas et Fœm.* niger, thorace cano vittis quatuor nigris, *alis* albis, *areolarum discis cinereo-maculatis*, venis albis apud costam testaceis, pedibus sordide testaceis, coxis femoribusque nigricantibus. Long.  $2\frac{1}{2}$ –3; alar.  $3\frac{1}{2}$ –4 lin.

*Male and Fem.* Black. Thorax above hoary, with four slender black stripes. *Wings* white, *with grey oblong spots on the discs of most of the areolets*; costal, radial, and cubital veins pale testaceous, the rest white. Halteres whitish. Abdomen very pubescent. Legs dingy testaceous, long, slender; coxae and femora blackish.

Not rare. (E.)

45. **albimanus**, Meig. Zw. i. 40. 45 (1818); Mcq.; Gim.; Stæg.; Zett.—*annularis*, Meig. Kl. Zw.; Panz. *Mas et Fœm.* niger, nitidus, *alis* limpidis, venis albidis apud costam nigris, metatarsis anticis nec non tibiis metatarsisque posterioribus albidis, apice nigris. Long.  $2\frac{1}{2}$ –3; alar.  $3\frac{1}{2}$ –4 lin.

*Male and Fem.* Black, shining. Wings limpid; costal, radial, and cubital veins black, the rest whitish. Halteres white. Legs slender, rather long; fore metatarsi white, generally black towards the tips; posterior tibiae and posterior metatarsi whitish, black towards the tips. *Male.* Antennæ with black plumes.

Generally distributed. (E. S. I.)

46. **vagans?** Meig. Zw. vi. 249. 91 (1830); Stæg.; Ros.; Zett. *Mas*, niger, *alis* albo-limpidis, venis albidis apud costam testaceis, *pedibus testaceis*. Long.  $2\frac{1}{2}$ ; alar. 4 lin.

*Male.* Black. Wings limpid-white; costal, radial, and cubital veins pale testaceous, the rest whitish. Halteres and legs testaceous. Abdomen very pubescent.

Not common. (E.)

47. **disclusus**, n. *Mas*, niger, *alis* albo-limpidis, venis albis apud costam testaceis, halteribus *pedibusque testaceis*, *tibiis anticis femoribus*

*que totis, necnon tibiis posterioribus tarsisque apice fuscescentibus.* Long.  $2\frac{1}{2}$ ; alar. 4 lin.

*Male.* Black. Antennæ with black plumes. Wings limpид-white; costal, radial, and cubital veins testaceous, the rest white. Halteres pale testaceous. *Legs testaceous; femora, fore tibiæ, and tips of the tibiæ and of the tarsi, brownish.*

Not common. In Mr. Saunders' collection. (E.)

48. **opacus?** Meig. Zw. vi. 249. 90 (1830). *Mas, ater, alis albo-limpidis, venis halteribusque albis, pedibus fuscis.* Long. 1; alar. 2 lin.

*Male.* Deep black. Antennæ with black plumes. Wings limpид-white; veins and halteres white. *Legs brown.*

Not common. (E.)

49. **albipes?** Zett. Dipt. Seand. ix. 3588. 124 (1850). *Mas et Fœm. niger, antennis basi flavis, alis pubescentibus sublimpidis, venis pedibusque albidis.* Long. 2–3; alar. 3–4 lin.

*Male and Fem.* Black. Antennæ pale yellow towards the base. Wings nearly limpид, pubescent; veins whitish. Halteres white. *Legs whitish, slender.* *Male.* Antennæ with black plumes.

Generally distributed. (E. S. I.)

50. **inopertus, n.** *Mas, niger, alis limpidis, venis albidis apud costam testaceis, abdomine pedibusque sordide viridibus.* Long. 2; alar. 3 lin.

*Male.* Black. Antennæ with black plumes. Wings limpид; costal, radial, and cubital veins pale testaceous, the rest whitish. Halteres whitish. *Abdomen and legs dull green.*

Not common. (E.)

51. **pedellus,** D. G. Ins. vi. 146. 17 (1783); Latr.; Meig.; Meq.; Zett.; Gim.; Stæg.—*fuscus*, L.—*littoralis*, Schr.; Geoff.—*cantans*, F.; Meig. Kl. Zw. *Mas et Fœm. niger, nitidus, alis albo-limpidis, abdomine viridi apicem versus nigro, pedibus viridibus, femoribus tibiis et tarsorum articulis apice nigris.* Long. 3–4; alar. 4–5 lin.

*Male and Fem.* Black, shining. Wings limpид-white; veins whitish. Halteres grass-green. *Abdomen grass-green, black towards the tip, clothed with white pubescence.* *Legs pale green; tips of the femora, of the tibiæ, and of the joints of the tarsi, black.* *Male.* Plumes of the antennæ brown, white towards the tips; fore tibiæ towards the tips, and fore metatarsi towards the base, black. *Fem.* Thorax green, with three black stripes.

Generally distributed. (E. S. I.)

52. **fuscipennis?** Meig. Zw. i. 36. 31 (1818).—Var.? *Fœm. viridi-niger, nitidus, alis subfuscis basi limpidis, venis halteribusque albidis, his apice nigricantibus, pedibus testaceis, tibiis apice nigris, femoribus antieis nigro-einetis.* Long. 3; alar. 6 lin.

Var.? *Fem.* Greenish-black, shining. Palpi and antennæ testaceous. Wings indistinctly tinged with brown, limpид towards the base; costal,

radial, and eubital veins pale, the rest whitish. Halteres whitish, with blackish tips. Abdomen blackish-green. Legs testaceous, long, slender; tips of the tibiæ black; fore legs very long, their femora with a broad black band towards the tips.

Rare. In the British Museum. (E.)

53. **occipiens**, n. *Mas, fuscus, thorace vittis tribus nigris, alis subeinereis, venis pedibusque testaceis, halteribus albidis.* Long.  $3\frac{1}{2}$ ; alar.  $4\frac{1}{2}$  lin.

*Male.* Brown, shining. Antennæ with black plumes. *Thorax with three black stripes.* Wings very slightly greyish; veins pale testaceous. Halteres whitish. Legs dark testaceous.

Rare. (E.)

54. **annularius**, D. G. Ins. vi. 146. 18 (1783); Latr.; Meig.; Meg.; Med.; Zett.; Gim. *Mas et Fœm. cinereus, thorace vittis tribus nigricantibus, alis sublimpidis, venis albidis apud eostam nigris, abdomine nigro, segmentorum marginibus postieis eanis, pedibus testaceis, tibiis et tarsorum articulis apiee nigris.* Long.  $3\frac{1}{2}$ -4; alar. 5-6 lin.

*Male and Fem.* Grey. Palpi and antennæ black. *Thorax with three blackish stripes.* Wings nearly limpid, slightly eiliated along the hind border; eostal, radial, and eubital veins, and discal transverse veinlet black, the rest whitish. Halteres whitish. Abdomen black, pubescent, with a hoary band on the hind border of each segment. *Legs testaceous;* coxae grey; tips of the tibiæ and of the joints of the tarsi black. *Male.* Antennæ with blackish plumes.

Generally distributed. (E. S. I.)

55. **obnixus**, n. *Mas, niger, thorace fulvo vittis tribus nigris, alis albo-limpidis, venis albis, halteribus pedibusque testaceis.* Long. 2; alar. 3 lin.

*Male.* Black. Antennæ with blackish plumes. *Thorax tawny, with three black stripes.* Wings limpid-white; veins white. Halteres and legs testaceous; tarsi darker.

Not common. (E.)

56. **brunnipes?** Zett. Dipt. Seand. ix. 3518. 35 (1850). *Mas et Fœm. nigro-fuscus, thorace fulvo vittis tribus nigris, alis sublimpidis, venis testaceis, halteribus albis, pedibus ferrugineis.* Long.  $2\frac{1}{2}$ -3; alar.  $4-4\frac{1}{2}$  lin.

*Male and Fem.* Blackish-brown. *Thorax tawny, with three very broad black stripes.* Wings nearly tawny; veins pale testaceous. Halteres white. Abdomen rather long. Legs ferruginous, long, slender. *Male.* Antennæ with blackish plumes.

Not common. (E.)

57. **pulsus**, n. *Mas et Fœm. obscure viridis, thorace vittis tribus nigris, alis limpidis, venis albis apud costam viridibus, pedibus viridibus, femoribus tibiis tarsisque apiee fusca.* Long.  $3-3\frac{1}{2}$ ; alar. 4-5 lin.

*Male and Fem.* Dark green. *Thorax with three black stripes.* Meta-

*Male and Fem.* Grass-green. *Thorax with three testaceous-green stripes.* *Wings limpid-white;* veins and halteres white. *Legs pale green, long, slender; tibiae with black tips; tarsi black; first and second joints white, black towards the tips.*

Not rare. (E.)

66. **imbecilis**, n. *Mas et Fœm. viridis, thorace vittis tribus luteis, alis albo-limpidis, venis albis apud costam testaceis, pedibus pallide viridibus.* Long.  $2\frac{1}{2}$ -3; alar. 3-4 lin.

*Male and Fem.* Green. *Thorax with three luteous stripes.* Metathorax and pectus luteous. *Wings limpid-white;* costal, radial, and cubital veins pale testaceous, the rest white. Halteres white. Abdomen with white pubescence. *Legs pale green, long, slender.* *Male.* Antennæ with pale brown plumes.

Not rare. (E.)

67. **dorsalis?** Meig. Zw. i. 25. 10 (1818); Stæg.; Zett. *Mas et Fœm. pallide viridis, thorace vittis tribus luteis, alis limpidis; Mas, abdominis segmentis fusco-fasciatis; Fœm. abdomine fusco, segmentorum marginibus posticis viridibus.* Long.  $3\frac{1}{2}$ ; alar. 5 lin.

*Male and Fem.* Pale green. *Thorax with three luteous stripes, the middle one double.* Metathorax brownish. *Wings limpid;* costal, radial, and cubital veins and discal transverse veinlet testaceous, the other veins whitish. Halteres white. Legs pale green, slender; tips of the tibiae, of the joints of the tarsi, and of the fore femora, and base of the fore tibiae, blackish. *Male.* Antennæ with brown plumes. *Abdominal segments with brown bands, which are broadest towards the tip.* *Fem.* Abdomen brown; hind borders of the segments pale green.

Not common. (E.)

68. **paganus?** Meig. Zw. vii. 7. 135 (1838).—Var.? *Mas et Fœm. prasinus, thorace vittis tribus vix conspicuis testaceis, alis albo-limpidis, venis albis, tibiis et tarsorum articulis apice nigricantibus.* Long.  $2\frac{1}{2}$ - $3\frac{1}{2}$ ; alar.  $3\frac{1}{2}$ -4 lin.

Var.? *Male and Fem.* Grass-green. *Thorax with three almost obsolete testaceous stripes.* *Wings limpid-white;* veins white. Halteres pale green. *Abdomen rather long.* *Legs pale green, long, slender; tips of the tibiae and of the joints of the tarsi blackish.* *Male.* Antennæ with brown plumes.

Not common. (E.)

69. **obreptans**, n. *Fœm. viridis, thorace vittis tribus luteis, alis limpidis, venis albidis, femoribus anticis tibiisque apice tarsisque totis nigricantibus.* Long. 2; alar. 4 lin.

*Fem.* Pale green. *Thorax with three luteous stripes.* Pectus and metathorax pale luteous. *Wings limpid;* veins whitish. Halteres pale green. Abdomen deep grass-green. *Legs pale green, long, slender; tarsi and tips of the tibiae and of the fore femora blackish.*

Not common. (E.)

70. **trichopus**, n. *Mas, viridi-testaceus, thorace vittis tribus fulvis, alis limpidis, venis halteribusque albidis, abdomine pilosissimo vitta dorsali fulva, pedibus testaceis pilosissimis.* Long. 3; alar. 4 lin.

*Male. Greenish-testaceous. Thorax with three tawny stripes. Wings limpid; veins and halteres whitish. Abdomen very pilose, with a slender tawny stripe. Legs pale testaceous, very pilose.*

Rare. In the British Museum. (E.)

71. **pallidicornis**, Steph. MSS. *Mas et Fœm. pallide viridis, thorace vittis tribus luteis, alis limpidis, venis albidis apud costam testaceis, halteribus albis, pedibus testaceis.* Long. 1-1 $\frac{1}{4}$ ; alar. 2 lin.

*Male and Fem. Pale green. Thorax with three pale luteous stripes. Wings limpid; costal, radial, and cubital veins pale testaceous, the rest whitish. Halteres white. Legs testaceous. Male. Antennæ with testaceous plumes.*

Rare. In the British Museum. (E.)

72. **albidus**, Wied. Meig. Zw. i. 51. 71 (1818). *Mas et Fœm. viridi-albus, thorace vittis tribus fulvis, alis albo-limpidis, venis albis apud costam stramineis, halteribus albis, pedibus albidis.* Long. 1 $\frac{1}{4}$ -1 $\frac{1}{2}$ ; alar. 3 lin.

*Male and Fem. Greenish-white. Thorax with three tawny stripes. Wings limpid-white; costal, radial, and cubital veins pale straw-colour, the rest white. Halteres white. Legs whitish, pubescent, slender, rather long.*

Not common. (E.)

73. **tendens**, F. E. S. iv. 243. 47 (1792); Meig.; Mcq.; Gim.; Staëg.; Zett. *Fœm. testaceus, nitidus, thorace convexiusculo antico subproducto, alis limpidis apud costam subtestaceis, venis halteribusque albidis, segmentorum abdominalium marginibus posticis pallidioribus.* Long. 3-4; alar. 6-8 lin.

*Fœm. Testaceous, shining. Palpi blackish. Thorax rather convex, slightly advanced in front. Wings limpid, with a slight testaceous tinge along the costa; veins and halteres whitish. Hind borders of the abdominal segments pale testaceous. Legs pale testaceous, long, slender.*

Not common. (E.)

74. **perennis?** Meig. Zw. vi. 249. 92 (1830). *Mas, niger, alis limpidis, venis halteribusque albidis, illis apud costam testaceis, pedibus fuscis.* Long. 1 $\frac{1}{2}$ ; alar. 3 lin.

*Male. Black. Antennæ with black plumes. Wings limpid; costal, radial, and cubital veins testaceous, the rest whitish. Halteres whitish. Legs brown, slender.*

Not common. (E.)

75. **discrepans**, n. *Mas, niger, nitens, alis albo-limpidis, venis albis apud costam testaceis, halteribus albidis, abdomine viridi, suturis*

the tibiæ, and of the joints of the tarsi, brown. *Male.* Antennæ with brown plumes.

Not common. In the British Museum. (E.)

84. **cingulatus**, Steph. MSS.—*modestus?* Meig.; Stæg.; Zett. *Mas. testaceus, thorace vittis tribus pallide fuscis, alis sublimpidis pubescentibus, venis albidis apud costam testaceis, abdomine fusco, segmentorum marginibus posticis albidis.* Long. 2; alar. 3 lin.

*Male. Testaceous. Thorax with three pale brown stripes.* Wings nearly limpid, pubescent; costal, radial and cubital veins testaceous, the rest whitish. Abdomen brown, very pilose, with a whitish band on each segment. Legs testaceous, slender, pubescent.

Rare. In the British Museum.

85. **ferrugineo-vittatus?** Zett. Dipt. Scand. ix. 3492. 10(1850); Zett. *Fœm. var.?* *viridis, thorace vittis tribus ferrugineis, alis limpidis, venis albidis apud costam testaceis, venula transversa fusca, abdomine nigro, segmentorum marginibus posticis viridibus, pedibus fulvis validiusculis, femoribus tibiis et tarsorum articulis apice nigris.* Long.  $2\frac{1}{2}$ —3; alar. 4—5 lin.

*Fem. Var.?* *Green.* Palpi and antennæ black. Thorax with three pale ferruginous stripes. Wings limpid; discal transverse veinlet pale brown; costal, radial, and cubital veins testaceous, the rest white. Halteres whitish. *Abdomen black; hind borders of the segments green.* Legs tawny, minutely pubescent, rather stout; tips of the femora, of the tibiæ, and of the joints of the tarsi, black.

Not rare. (E.)

86. **nigrimanus**, Stæg.; Dipt. Dan. 566. 21 (1840); Zett. *Fœm. viridis, thorace vittis tribus rufis, alis albo-limpidis, venis albidis apud costam testaceis, segmentorum abdominalium marginibus posticis albidis, pedibus pallide viridibus, tarsis testaceis, femoribus anticis apice necnon tibiis tarsisque anticis totis fuscis.* Long. 3— $3\frac{1}{2}$ ; alar. 5—6 lin.

*Fem. Green.* Thorax with three red stripes. Wings limpid-white; costal, radial, and cubital veins testaceous, the rest white. Halteres pale testaceous. *Hind borders of the abdominal segments whitish.* Legs pale green; tarsi testaceous; fore tibiæ, fore tarsi, and tips of the fore femora, brown.

Not common. (E.)

87. **irretitus**, n. *Mas. et Fœm. albido-viridis, thorace vittis tribus testaceis, alis albo-limpidis, venis halteribusque albis, tarsis anterioribus tibiisque apice nigris.* Long. 2— $2\frac{1}{2}$ ; alar. 3—4 lin.

*Male and Fem. Whitish-green.* Thorax with three pale testaceous stripes. Wings limpid-white; veins and halteres white. Abdomen pubescent. *Legs greenish-white, slender; tibiæ and anterior tarsi with black tips.*

Not common. (E.)

88. **sticticus**, F. Sp. Ins. ii. 407. 38 (1791); Gmel.; Meig.; Meq.;

Gim. ; Zett.—*histrio*, F. ; Meig.—*pictulus*, Hoffm. ; Meig. ; Zett. *Mas et Fœm.* niger, thorace cano vittis tribus nigris, alis albis maculis tribus cinercis, venis albis apud costam testaceis, venula transversa nigra, segmentorum abdominalium marginibus posticis albis, pedibus albidis, femoribus fuscescentibus, tibiis et tarsorum articulis apice nigris, his basi fasciaque nigris. Long. 3 ; alar. 5 lin.

Black. Thorax hoary, with three black dorsal stripes. Wings white, with a black discal dot, and with three pale grey spots in the disc of the areolets, two along the hind border, one towards the tip ; costal, radial and cubital veins pale testaceous, the rest white. Halteres whitish. Abdomen with a white band on the hind border of each segment. Legs whitish, pubescent ; tips of the femora, of the tibiae, and of the joints of the tarsi, black ; femora brownish for three-fourths of the length from the base ; tibiae black at the base, and with a black band. *Male.* Antennæ with black plumes.

Common. (E. S. I.)

89. ***lucidus*?** Zett. I. L. 810. 5 (1837). *Mas et Fem.* niger, *alis limpidis, venis albidis apud costam fuscis, halteribus testaceis, pedibus nigro-fuscis.* Long. 3–4 ; alar. 6 lin.

*Male and Fem.* Black. *Wings limpid; costal, radial and cubital veins brown, the rest whitish.* Halteres pale testaceous. Legs blackish-brown, long, slender. *Male.* Antennæ with black plumes.

Not rare. (E.)

90. ***leucopus*?** Meig. Zw. vi. 249. 93 (1830).—*nigrinus?* Mcq. *Mas, niger, alis albo-limpidis, venis albidis apud costam testaceis, halteribus albis, pedibus testaceis, femoribus, tibiis et tarsorum articulis apice fuscis.* Long. 3½ ; alar. 5 lin.

*Male.* Black. Antennæ with blackish plumes. *Wings limpid-white; costal, radial and cubital veins pale testaceous, the rest whitish.* Halteres white. Legs pale testaceous, long, slender, pubescent ; tips of the femora, of the tibiae, and of the joints of the tarsi, brown.

Rare. (E.)

91. ***carbonarius***, Meig. Zw. i. 40. 43 (1818); Gim. *Mas et Fœm.* niger, *alis albo-limpidis, venis halteribusque albidis, illis apud costam testaceis, pedibus fuscis.* Long. 3–4 ; alar. 5–6 lin.

Black. *Wings limpid-white; costal, radial and cubital veins pale testaceous, the rest whitish.* Halteres whitish. Legs brown, long, slender. *Male.* Antennæ with black plumes.

Nearly allied to *C. lucidus*, but more slender ; abdomen longer. Common. (E. S. I.)

92. ***morulus***, n. *Mas. niger, nitens, alis limpidis, venis halteribusque albidis, illis apud costam testaceis, pedibus nigro-fuscis, tibiis testaceis basi nigro-fuscis, femoribus anticis basi testaceis.* Long. 3 ; alar. 5 lin.

*Male.* Black, shining. Antennæ with black plumes. *Wings limpid; costal, radial, and cubital veins testaceous, the rest whitish.* Halteres

testaceis, femoribus tibiisque apice tarsisque totis fuscis. Long.  $1\frac{1}{2}$ ; alar. 3 lin.

*Male and Fem.* *Pale testaceous.* Thorax with three brown stripes. Metathorax black. Wings limpid; costal, radial, and cubital veins, and discal transverse veinlet testaceous, the other veins whitish. Halteres whitish. Legs pale testaceous; tarsi and tips of the femora and of the tibiæ brown.

Rare. (E.)

102. **zonarius**, n. *Mas, viridis, thorace vittis tribus fuscis, alis limpidis, venis albidis apud costam testaceis, halteribus albis, abdominis segmentis fusco-fasciatis, pedibus viridibus, femoribus tibiis et tarsorum articulis apice nigris.* Long.  $2\frac{1}{2}$ ; alar. 3 lin.

*Male.* *Green.* Antennæ with brown plumes. *Thorax with three brown stripes, the middle one double.* Pectus and metathorax brownish. Wings limpid; costal, radial, and cubital veins pale testaceous, the rest whitish. Halteres white. *Abdomen with brown bands, which occupy nearly the whole of the three apical segments.* Legs pale green; tips of the femora, of the tibiæ, and of the joints of the tarsi, black.

Rare. In the British Museum. (E.)

103. **rufipes**, L. F. S. 439. 1778 (1761); F.; Meig.; Stæg.; Zett.—*bifasciatus*, Meig.; Mcq. *Niger, nitens, alis albidis fascia lata fusca, abdominis segmentis fulvo-fasciatis, pedibus testaceis, tibiis et tarsorum articulis apice nigris, tarsis anticis nigris basi testaceis.* Long.  $3-3\frac{1}{2}$ ; alar. 5–6 lin.

Black, shining, stout. Wings whitish, with a broad brown band a little before the middle, nearly evanescent towards the hind border; costal, radial, and cubital veins testaceous, the rest whitish. Halteres testaceous. Abdomen pubescent, with a tawny band on each segment. Legs testaceous, stout; tips of the tibiæ and of the joints of the tarsi black; fore tarsi black, excepting the metatarsus. *Male.* Antennæ with brown plumes. Legs partly pubescent.

Rare. In the British Museum. (E.)

104. **intextus**, n. *Mas, niger, gracilis, alis albo-limpidis, venis halteribusque albis, pedibus pallide fuscis.* Long.  $3\frac{1}{2}$ ; alar. 4 lin.

*Male.* Black, slender. Antennæ with black plumes. Wings limpid-white; veins and halteres white. Abdomen very long. *Legs pale brown,* slender.

Rare. (E.)

105. **oppetitus**, n. *Mas, niger, alis albo-limpidis, venis albidis apud costam testaceis, venuula transversa nigra, segmentorum abdominalium marginibus posticis albidis, pedibus testaceis, femoribus tibiis et tarsorum articulis apice nigricantibus.* Long. 3; alar. 5 lin.

*Male.* Black. Antennæ with black plumes. Wings limpid-white; costal, radial, and cubital veins testaceous, the other veins whitish; discal transverse veinlet black. Halteres testaceous. *Abdomen pubes-*

cent, with a whitish band on the hind border of each segment. Legs dark testaceous; tips of the femora, of the tibiæ, and of the joints of the tarsi, blackish.

Rare. (E.)

106. **marcidus**, n. *Mas, niger, alis limpidis, venis albidis apud costam testaceis, halteribus albis, pedibus testaceis.* Long. 2; alar. 3 lin.

*Male. Black.* Antennæ with black plumes. Wings limpid; costal, radial, and cubital veins pale testaceous, the rest whitish. Halteres white. Abdomen very pubescent. Legs slender, pale dull testaceous.

Rare. (E.)

107. **obvertens**, n. *Mas et Fœm. viridis, thorace vittis tribus rufescentibus, alis albo-limpidis, venis halteribusque albis, illis apud costam testaccis, venula transversa fuscescente, pedibus testaceis, femoribus tibiis et tarsorum articulis apice nigris.* Long.  $2\frac{1}{2}$ -3; alar. 5 lin.

*Male and Fem. Green.* Thorax with three pale reddish stripes. Wings limpid-white; discal transverse veinlet brownish; costal, radial, and cubital veins pale testaceous, the rest white. Halteres white. Legs testaceous, long, slender; tips of the femora, of the tibiæ, and of the joints of the tarsi, black.

Not common. (E.)

108. **convestitus**, n. *Mas, niger, thorace ferrugineo vittis tribus nigris, alis cinereis, venis albidis apud costam fuscis, pedibus ferrugineis.* Long.  $2\frac{1}{2}$ ; alar. 4 lin.

*Male. Black.* Antennæ with blackish plumes. Thorax ferruginous, with three black stripes. Pectus hoary. Wings grey; costal, radial, and cubital veins brown, the rest whitish. Halteres white. Abdomen pubescent. Legs ferruginous.

Rare. (E.)

109. **perreptans**, n. *Mas, niger, thorace vittis tribus virescentibus, alis sublimpidis, venis albis apud costam nigris, halteribus albidis, abdome viridi suturis nigris, pedibus viridibus, femoribus tibiisque apice tarsisque nigris.* Long. 3; alar. 5 lin.

*Male. Black.* Antennæ with black plumes. Thorax with three greenish stripes. Wings nearly limpid; costal, radial, and cubital veins, and discal transverse veinlet black, the rest white. Halteres whitish. Abdomen dingy green; sutures black. Legs dingy green, slender; tarsi and tips of the femora and of the tibiæ black.

Not common. (E.)

110. **hebescens**, n. *Fœm. testaceo-viridis, subcanescens, thorace vittis tribus cinereis, alis albo-limpidis, venis halteribusque albidis, illis apud costam testaceis, venula transversa fusea, abdomine pedibusque viridibus, tarsorum articulis apice fuscis.* Long.  $3\frac{1}{2}$ ; alar. 6 lin.

*Fem. Testaceous-green, with a slight hoary tinge.* Thorax with three grey stripes. Metathorax mostly grey. Wings limpid-white; costal, radial, and cubital veins pale testaceous, the rest whitish; discal trans-

*whitish*. Halteres white. Abdomen long, slender. Legs blackish, long, slender.

Rare. (E.)

122. **oblidens**, n. *Mas, ater, alis subcinereis, venis albidis apud costam nigricantibus*. Long.  $2\frac{1}{2}$ ; alar. 4 lin.

*Male*. Deep black. Antennæ with black plumes. Wings slightly greyish; costal, radial, and cubital veins blackish, the rest whitish. Legs rather long and slender.

Rare. (E.)

123. **effusus**, n. *Mas et Fœm. niger, alis sublimpidis, venis albidis apud costam testaceis, halteribus fuscis, abdomine nigro-fusco, pedibus obscure testaceis*. Long.  $1-1\frac{1}{4}$ ; alar. 2 lin.

*Male and Fem. Black*. Wings nearly limpid; costal, radial and cubital veins pale testaceous, the rest whitish. Halteres brown. Abdomen dark brown. Legs dull testaceous, pubescent. *Male*. Antennæ with brown plumes.

Not rare. (E.)

124. **fuscipes**, Meig. Zw. i. 49. 65 (1818); Mcq.; Stæg.; Ros.; Zett. *Mas, niger, alis subcinereis pubescensibus, venis albidis, halteribus albis, pedibus fuscescentibus*. Long. 1; alar.  $1\frac{3}{4}$  lin.

*Male*. Black. Antennæ with black plumes. Wings slightly greyish, pubescent; veins whitish. Halteres white. Legs brownish.

Rare. In the British Museum. (E.)

125. **venosus?** Meig. Zw. vi. 253. 105 (1830). *Mas, niger, thorace vittis tribus testaceis, atis sublimpidis, venis halteribusque albidis, illis apud costam nigricantibus, segmentorum abdominalium marginibus posticis fulvis, pedibus sordide testaceis, femoribus tibiis et tarsorum articulis apice nigris*. Long. 2-3; alar.  $4-4\frac{1}{2}$  lin.

*Male*. Black. Antennæ with black plumes. Thorax testaceous on each side, and with three very slender testaceous stripes. Wings nearly limpid; costal, radial, and cubital veins, and discal transverse veinlet blackish, the other veins whitish. Halteres whitish. Abdomen with a tawny band on the hind border of each segment, clothed with whitish down. Legs dingy testaceous; tips of the femora, of the tibiæ, and of the joints of the tarsi black.

Not rare. (E.)

126. **incomptus**, n. *Mas, niger, validiusculus, thorace fulvo vittis tribus latissimis nigris, alis subcinereis, venis nigricantibus, halteribus albidis, segmentorum abdominalium marginibus posticis cinereis, pedibus fulvis, tarsis nigris*. Long.  $2\frac{1}{2}$ ; alar. 4 lin.

*Male*. Black, rather stout. Antennæ with black plumes. Thorax tawny above, with three very broad black dorsal stripes. Wings greyish; veins mostly blackish. Halteres dingy whitish. Abdomen pubescent, with a grey band on the hind border of each segment. Legs tawny, rather stout; tarsi black.

Not common. (E.)

127. **persidens**, n. *Mas, niger, thorace sordide testaceo vittis tribus latis nigris, alis sublimpidis, venis albidis apud costam testaceis, pedibus fuscis.* Long. 2; alar. 3 lin.

*Male. Black.* Antennæ with black plumes. Thorax dingy testaceous, with three broad black dorsal stripes. Wings nearly limpid, slightly clouded with black at the base; costal, radial, and cubital veins testaceous, the rest whitish. Halteres white. Abdomen pubescent. Legs brown, slender.

Rare. (E.)

128. **expalpans**, n. *Mas, albidus, thorace vittis tribus nigris, alis subcinereis pubescensibus, venis testaceis, halteribus albidis, abdomine fusco segmentorum marginibus posticis albidis, pedibus testaceis, femoribus tibiis tarsisque apice nigricantibus.* Long.  $2\frac{1}{2}$ ; alar.  $3\frac{1}{2}$  lin.

*Male. Whitish.* Palpi and antennæ black, the latter with brown plumes. Thorax with three black stripes. Wings slightly greyish, pubescent; veins testaceous. Halteres whitish. Abdomen brown above, with a whitish band on the hind border of each segment. Legs testaceous, minutely pubescent, moderately long; tarsi towards the tips, and tips of the femora and of the tibiæ, blackish.

Not rare. (E.)

129. **obditus**, n. *Mas et Fœm. testaceus, validus, thorace vittis tribus vix divisis nigris, alis sublimpidis, venis apud discum fuscis, halteribus albidis, abdomine fusco, pedibus ferrugincis, tibiis anticis tarsisque fuscis.* Long. 2–3; alar. 4–5 lin.

*Testaceous, stout. Thorax with three black, almost confluent, stripes. Metathorax and pectus mostly black. Wings nearly limpid; costal, radial, and cubital veins, and discal transverse veinlet brown, the other veins paler. Halteres whitish. Abdomen brown, shining, pubescent. Legs ferruginous, long, slender; tarsi and fore tibiæ dark brown. Male. Antennæ with black plumes.*

Not common. (E.)

130. **olivaceus**, Meig. Zw. i. 29. 18 (1818); Mcq.; Stæg.; Zett. *Mas et Fœm. fulvo-viridis, thorace vittis tribus nigris, alis subcinereis, venis halteribusque albidis, illis apud costam fuscis, abdomine fuscescente, pedibus fulvis, tibiis anticis tarsisque fuscis.* Long.  $2\frac{1}{2}$ ; alar. 5 lin.

*Male and Fem. Dull tawny green. Thorax with three black stripes. Pectus and metathorax black. Wings slightly grey; costal, radial, and cubital veins brown, the rest whitish. Halteres whitish. Abdomen brownish. Legs dull tawny; tarsi and fore tibiæ brown.*

Not common. In the British Museum. (E.)

131. **rubicundus?** Meig. Zw. i. 35. 33 (1818). *Fœm. pallide testaceus, thorace vittis tribus cinereis, alis albo-limpidis, venis halteribusque albis, illis apud costam testaceis, abdomine rufescente, femoribus tibiis et tarsis apice fuscescentibus.* Long. 1; alar.  $2\frac{1}{2}$  lin.

*Fem. Pale testaceous. Thorax with three grey stripes. Metathorax*

*ribusque albidis, illis apud costam fuscis, pedibus validiusculis. Long. 2½; alar. 4 lin.*

*Male. Black, stout. Antennæ with black plumes. Thorax shining. Wings nearly limpid; costal, radial, and cubital veins, and discal transverse veinlet brown, the other veins whitish. Halteres whitish. Abdomen pubescent. Legs rather stout.*

Rare. (E.)

143. **novatus**, n. *Mas et Fœm. nigro-cinereis, alis subcinereis, venis albidis apud costam fuscescentibus, halteribus albis, pedibus obscure fuscis. Long. 1½–2; alar. 2½–3½ lin.*

*Male and Fem. Cinereous-black. Wings very slightly greyish; costal, radial, and cubital veins pale brownish, the rest whitish. Halteres white. Legs dark brown, slender. Male. Antennæ with black plumes.*

Common. (E.)

144. **nigratus**, n. *Fœm. niger, alis sublimpidis, venis albidis apud costam nigricantibus, halteribus pedibusque testaccis, femoribus tibiis tarsisque apice nigricantibus. Long. 1; alar. 2 lin.*

*Fem. Black. Wings nearly limpid; costal, radial, and cubital veins blackish, the rest whitish. Halteres testaceous. Legs testaceous, slender; tips of the femora, of the tibiae, and of the tarsi blackish.*

Rare. (E.)

145. **impensus**, n.—*abdominalis?* Stæg.; Zett. *Fœm. niger, alis albo-limpidis pubescensibus, venis halteribusque albis, abdomine rufescente, pedibus testaceis validiusculis. Long. ¾; alar. 1½ lin.*

*Fem. Black. Wings limpid-white, pubescent; veins and halteres white. Abdomen reddish. Legs testaceous, rather short and stout.*

Rare. In the British Museum. (E.)

146. **tibialis?** Meig. Zw. i. 41. 47 (1818); Mcq.; Gim.; Zett. Var.? *Mas, niger, thoracis lateribus fulvis, alis sublimpidis, venis halteribusque albidis, illis apud costam testaceis, segmentorum abdominalium marginibus posticis canis, pedibus fuscescentibus, tibiis albido-unifasciatis. Long. 2; alar. 3½ lin.*

*Var.? Male. Black. Antennæ with brown plumes. Thorax tawny on each side. Wings nearly limpid; costal, radial, and cubital veins testaceous, the rest whitish. Halteres whitish. Abdomen with a hoary band on each segment. Legs brownish; a whitish band on each tibia.*

Rare. In the British Museum. (E.)

147. **nexilis**, n. *Mas, canus, thorace vittis tribus nigricantibus, alis sublimpidis, venis albidis apud costam fuscescentibus, halteribus albis, abdomine piceo, pedibus testaceis, tibiis et tarsorum articulis apice nigris. Long. 2½; alar. 4 lin.*

*Male. Hoary. Antennæ with black plumes. Thorax with three blackish stripes. Wings nearly limpid; costal, radial, and cubital veins pale brownish, the rest whitish. Halteres white. Abdomen piceous.*

*Legs dull testaceous, long, slender; tips of the tibiæ and of the joints of the tarsi black.*

Rare. (E.)

148. **offectus**, n. *Mas, niger, thorace cano vittis tribus fere conjunctis nigris, alis subcinereis, venis albido-testaceis, abdomine nigro-piceo, pedibus fuscis.* Long.  $2-2\frac{1}{2}$ ; alar.  $3\frac{1}{2}-4$  lin.

*Male. Black, slender. Antennæ with black plumes. Thorax hoary, with three black, almost confluent, stripes. Wings slightly greyish; veins whitish-testaceous. Abdomen piceous-black. Legs brown, long, slender.*

Not common. (E.)

149. **sordidellus?** Zett. I. L. 814. 26 (1840). *Mas et Fœm. testaceus, thorace vittis tribus nigris, alis subcinereis, venis albidis apud costam testaceis, venula transversa fusca, halteribus albis, abdomine fusco, pedibus testaceis, tibialis et tarisorum articulis apice nigricantibus.* Long.  $2-3$ ; alar.  $4-5$  lin.

*Testaceous. Thorax with three black stripes. Metathorax and disc of the pectus black. Wings very slightly greyish; costal, radial, and cubital veins testaceous, the rest whitish; discal transverse veinlet brown. Halteres white. Abdomen brown. Legs dull testaceous, long, slender; tips of the tibiæ and of the tarsi blackish. Male. Antennæ with blackish plumes.*

Not common. (E.)

*Fem. Black. Wings nearly limpid; costal, radial, and cubital veins black, the rest whitish. Halteres whitish, with black tips. Legs whitish, slender.*

Rare. (E.)

185. **divisus**, n. *Mas, pallide testaceus, thorace vittis rufescens, alis subcinereis pubescentibus, venis albidis, halteribus albis, abdomine fasciis duabus anticus fuscis, segmentis tribus apicalibus nigris, pedibus albidis.* Long. 2; alar. 3 lin.

*Male. Pale testaceous. Palpi and antennæ black. Thorax with three pale reddish stripes. Wings very slightly greyish, pubescent; veins whitish. Halteres white. Abdomen pale testaceous, pubescent, with two brown bands before the middle; three apical segments black. Legs whitish, slender.*

Rare. (E.)

186. **annulipes?** Meig. Zw. i. 42. 51 (1818). Var.? *Fœm. flavus, thorace vittis tribus nigris, alis subcinereis, venis albidis apud costam fuscis, halteribus flavis, abdomine nigro, segmentorum marginibus posticis flavis, pedibus nigris validiusculis, femoribus basi flavis, tibiis albo-cinctis.* Long.  $1\frac{3}{4}$ ; alar. 3 lin.

*Var.? Fem. Yellow. Thorax with three moderately broad black stripes; scutellum, pectus, and metathorax black. Wings greyish; costal, radial, and cubital veins brown, the rest whitish. Halteres pale yellow. Abdomen black; hind borders of the segments yellow. Legs black, rather stout; femora yellow towards the base; a white band on each tibia.*

Rare. In the British Museum. (E.)

187. **pygmæus?** Meig. Zw. i. 36. 34 (1818). Var.? *Fœm. testaceus, thorace vittis tribus fuscis, alis vix cinereis, venis halteribusque albidis, illis apud costam fuscescentibus, abdomine vitta dorsali nigricante, pedibus testaceis.* Long.  $\frac{3}{4}$ ; alar. 2 lin.

*Var.? Fem. Testaceous. Thorax with three brown stripes. Wings hardly greyish; costal, radial, and cubital veins brownish, the rest whitish. Halteres whitish. Abdomen with a blackish dorsal stripe. Legs dull testaceous.*

Rare. In the British Museum.

## GROUP 2.

*Hydrobaenus*, Fries, Kongl. Vet. Acad. Handl. 1829. 176. *Psilocerus*, Ruthe, Isis, 1831. 1207.

This group only contains the following species, which inhabits several parts of North Europe, but has not yet been certainly found in Britain.

188.\* **lugubris**, Fries, Kongl. Vet. Acad. Handl. 1829. 176 (1829). —*occultans*, Meig.; Ruthe; Zett. Ater, opacus, alis nigricantibus, pedibus piceis. Long.  $\frac{3}{4}$  lin.

## GROUP 3.

189. **lacustris**, Hal. Westw. Class II. Syn. Gen. Brit. Ins. 125 (1840). *Prasinus*, mesonoti vittis tribus et pectore carneis, alis albidis nudis, tibiis anticis fuscis. Long. mas 2, fœm.  $1\frac{1}{2}$ ; alar. 3 lin.

Light grass-green. Palpi dusky, except the base. Three confluent stripes on the mesonotum and the mesosternum (flesh-colour or) ferruginous, also the mesothorax, dusky at the tip. Wings whitish-hyaline, naked; veins light yellowish. Halteres pale. Fore tibiæ and fore tarsi, except the base, dusky; posterior tarsi dusky only towards the end; first joint of fore tarsi twice as long as the tibia in the female, more elongated in the male; fifth joint not half as long as the fourth. *Male*. Antennæ twelve-jointed, dingy yellow, with yellowish plumes; last joint much longer than the rest together. *Fem.* Antennæ seven-jointed; the last joint dusky, linear, one-third of the length of the entire antenna.

Found by Mr. Haliday by Loch Fad (Bute), Lough Neagh, and Lough Dirg. (S. I.)

## GROUP 4.

*Diamesa*, Meig. Zw. vii. 12 (1838); Zett.; Stæg.

190. **obscurimanus**, Meig. Zw. vi. 248. 88 (1830). *Fœm. obscure testaceus*, palpis antennisque nigris, thorace vittis tribus piceis, alis cinereis, venis halteribusque albidis, illis apud discum nigris, abdominis segmentis testaceo-marginatis, pedibus fulvis, tarsis nigris. Long. 3; alar. 6 lin.

*Fem.* Dark testaceous, shining. Palpi and antennæ black, the latter seven-jointed, testaceous at the base. Thorax with three piceous stripes, the middle one subdivided. Wings grey; costal, radial, and cubital veins, and præbrachial transverse veinlet black, the rest whitish; *pobra-chial areolet closed before the fork of the pobra-chial vein* (as in *Tanypus punctipennis*, etc.). Halteres whitish. Abdomen black; hind borders of the segments testaceous. Legs tawny, rather stout, minutely pubescent;

\* Since the Synopsis, p. 152–154, was printed, the species numbered 188 has been ascertained to belong to the genus *Corynoneura*.

tarsi black; *fourth joint about twice as long as the fifth*. *Male*. Antennæ plumate; last joint linear, much longer than the rest united.

Not rare. (E. I.)

191. **Chiron**, Hal. MSS. *Mas*, “*cinereus*, pleuris pedibusque flavidis, tarsis anticis barbatis. Long. 2; alar. 4 lin.”

*Male*. “Antennæ brownish-yellow; first joint dusky cinereous; feathers yellowish; last joint much longer than the rest jointly. Thorax with the sides ferruginous before the wings (scutellum also, but darker). Wings hyaline; veins very pale (so that the characteristic transverse vein is easily overlooked); pobrachial areolet closed a little beyond the fork of the pobrachial vein. Halteres pale yellow. Legs and coxæ ferruginous; only the tips of the tarsi dusky; *fourth joint of the tarsi about twice as long as the fifth*; posterior femora and tibiæ hairy; fore tarsi still more so; first joint a little shorter than the tibia. (Abdomen lost in the only specimen.)”—*Hal. MSS.*

Rare. Found by Mr. Haliday, near Holyrood, Belfast. (I.)

192. **Waltlii**, Mcig. Zw. vii. 13. 1 (1838). “*Fœm. nigricans*, *thoracis dorso schistaceo*. Long.  $2\frac{1}{3}$ ; alar.  $4\frac{1}{2}$  lin.

“*Fem.* Blackish, with a slaty-grey tinge on the vertex, mesonotum, and metanotum, and three faint, darker, shifting stripes on the mesonotum. Antennæ eight-jointed; last joint long-elliptical, as long as the three preceding. Wings hyaline, with the anterior veins conspicuous fuscous; the pobrachial areolet closed beyond the fork of the pobrachial vein (as in *Tanypus nebulosus*). Incisures of the abdomen with a paler shade. Legs finely pubescent; first joint of the fore tarsi shorter than the tibiæ; *fourth shorter than the fifth, notched at the tip*.”—*Hal. MSS.*

Rare. (E. I.)

193. **Ammon**, Hal. MSS. “*Schistaceus*, femoribus tibiisque posterioribus flavidis anticis fuscis; *Mas*, alis albis; *Fœm. antennis 8-articulatis*, pleuris et ventre flavidis, alis subhyalinis. Long. 2; alar. 4 lin.

“Pale slaty-grey. Fore legs dusky; femora at the base and coxæ light ferruginous; posterior femora and posterior tibiæ ferruginous, except at the tips; (tarsi sometimes lighter brown at the base;) fourth joint the shortest, notched, almost obcordate. *Male*. Front broad. Eyes a little emarginate internally. Antennæ nearly as long as the thorax; first joint dusky, rest dingy-yellowish; last nearly two-thirds of the whole length; feathers light yellowish; sides of the thorax generally a little ferruginous before the wings. Wings white, as is also the very faint pubescence of the hind margin; the usual veins pale brownish, whitish towards the base. Abdomen blackish, clothed with long, pale soft hairs; first joint of fore tarsus about as long as the tibiæ. *Fem.* Antennæ eight-jointed, dusky; first joint thick, ferruginous; last longer than the three preceding together. Thorax ferruginous, with three confluent bands on the mesonotum; scutellum rather pitchy-redish; metanotum and mesosternum pale slaty-grey. Wings hyaline,

rather obscure, broader than in the male; veins more evident, dusky-ferruginous. Abdomen above dark grey, except the incisures, or (in immature specimens) with only an interrupted dusky line down the back; first joint of the fore tarsus shorter than the tibia."—*Hal. MSS.*

Found by Mr. Haliday on sand hills in county Down, also in Cork, and in Kerry. (I.)

194. **Typhon**, Hal. MSS. *Fœm. schislaceus, antennis 7-articulatis, alis albis, pleuris, ventre, femoribus tibiisque posterioribus flavidis antieis fuseis. Long. 2; alar. 4 lin.*

*Fœm.* "Very like the preceding species, but with the antennæ seven-jointed. Pale yellowish. Vertex, three confluent stripes on the mesonotum, metanotum, and mesosternum cinereous (scutellum paler). Antennæ fuseous; first joint ferruginous; seventh elliptical, as long as the three preceding, or more. Wings white-hyaline; usual veins distinct, fuscous, yellowish towards the base; pobrachial areolet closed beyond the fork of the pobrachial vein. Abdomen above cinereous, with pale incisures; coxae ferruginous, outwardly cinereous. Fore legs dusky; femora at the base and coxae pale yellowish; posterior femora and tibiae ferruginous, with dusky tips; fourth joint of the tarsi short, obcordate, notched at the tip; first joint of the fore tarsi very little shorter than the tibia."—*Hal. MSS.*

Rare. One specimen found by Mr. Haliday at Blarney, near Cork, in September. (I.)

195. **tonsus**, Hal. MSS. *Mas, "schistaceus, antennis parce ciliatis, articulo extremo parum elongato, pleuris flavidis, alis subhyalinis, pedibus anticis fuseis, femoribus tibiisque posterioribns flavidis. Long. 1½; alar. 3 lin."*

*Male.* "The smallest of this group, not unlike *C. Ammon*, but the antennæ quite different, the forceps light-coloured (and differently formed?), and the wings not white. Pale ferruginous. Vertex, mesonotum, metanotum, and mesosternum pale slaty-grey. Eyes distant, but little notched. Antennæ dingy-yellowish, half the length of the thorax; last joint elongate-elliptical, not one-fourth of the length of the antennæ; second and next joints subglobose, then gradually increasing in length, and becoming oblong, *scantly verticillate, with long hairs, not forming a plume as usual.* Wings obscurely hyaline; veins light rust-brown; pobrachial areolet scarcely passing the fork of the pobrachial vein. Abdomen dusky, with narrow pale incisures; forceps ferruginous (the claw paler, dilated for half its length, and dentieulated internally). Legs pale ferruginous, longer than in *C. Ammon*; femora and tibiae at the tips (fore pair almost entirely), and tarsi brownish; fourth joint of the tarsus shorter than the fifth, notched at the tip; first joint shorter than the tibiae."—*Hal. MSS.*

Rare. One male found by Mr. Haliday on Mourne Mountains, county Down, and another at Fir House, near Dublin. (I.)

The following additional species of *Chironomus* have been recorded as British:—

1. C. obscuripes, *Meig.* *Zw.* vi. 244. 76 (1830).
  2. C. scutellatus, *Meig.* *Zw.* i. 33. 28 (1818).
  3. C. terminalis, *Meig.* *Zw.* i. 34. 29 (1818).
  4. C. thoracicus, *Wd.*; *Meig.* *Zw.* i. 32. 24 (1818).
  5. C. cingulatus, *Meig.* *Zw.* vi. 245. 77 (1830).
  6. C. pilicornus, *Fabr.* *Ent. Syst.* iv. 243. 45 (1805).
  7. C. vitripennis, *Meig.* *Zw.* i. 32. 26 (1818).
  8. C. laetus, *Meig.* *Zw.* i. 38. 39 (1819).
  9. C. nitidus, *Meig.* *Zw.* i. 35. 32 (1818).
  10. C. dispar, *Meig.* *Zw.* vi. 247. 85 (1830).
  11. C. perennis, *Meig.* *Zw.* vi. 249. 92 (1830).
  12. C. proximus, *Meig.* *Zw.* vi. 250. 96 (1830).
  13. C. geniculatus, *Fabr.* *Ent. Syst.* iv. 247. 68 (1794).
  14. C. gibbosus, *Meig.* *Zw.* vi. 252. 102 (1830).
  15. C. annulipes, *Meig.* *Zw.* i. 42. 51 (1818).
  16. C. pygmæus, *Meig.* *Zw.* i. 36. 34 (1818).
  17. C. melaleucus, *Meig.* *Zw.* i. 39. 41 (1818).
  18. C. tristis, *Wd.*; *Meig.* *Zw.* i. 48. 62 (1818).
  19. C. niger, *Mcq.* *D. N. I.* 13 (1826), *H. N. D. i.* 53. 28 (1834).
  20. C. leucopogon, *Meig.* *Zw.* i. 39. 42 (1818).
  21. C. fuscus, *Meig.* *Zw.* i. 52. 75 (1818).
  22. C. picipes, *Meig.* *Zw.* i. 52. 74 (1818).
  23. C. flavipes, *Meig.* *Zw.* i. 50. 67 (1818).
  24. C. Junci, *Meig.* *Zw.* i. 56. 68 (1818).
  25. C. affinis, *Wd.*; *Meig.* *Zw.* i. 51. 72 (1818).
  26. C. albidus, *Wd.*; *Meig.* *Zw.* i. 51. 71 (1818).
  27. C. tenuis, *Meig.* *Zw.* vi. 255. 112 (1830).
  28. C. nanus, *Meig.* *Zw.* i. 50. 69 (1818).
  29. C. flabellatus, *Meig.* *Zw.* i. 51. 70 (1818).
- 

## Genus II. **TANYPUS.**

*TANYPUS*, *Meig.* *Klass.* i. (1804); *Panz.*; *Latr.*; *Wied.*; *Fries*; *Mcq.*; *Curt.*; *Zett.*; *Gim.*; *Stæg.* *Tipula* p., *L.*; *D. G.*; *F. E. S.*; *Schr.*; *Gmel.*; *Meig.* *Kl.* *Chironomus* p., *F. S. A.*

Corpus elongatum, pubescens, mediocre aut parvum. Oculi reniformes, remoti. Proboscis brevis. Palpi 4-articulati, incurvi, subcylindrici, articulus primus secundo multo brevior; secundus tertio brevior; quartus tertio multo longior. Antennæ 14-articulatae, porrectæ, filiformes. Thorax ovatus, convexus. Scutellum mediocre. Metathorax semi-ovatus, subgibbosus, sulcatus. Alæ angustæ, elongatae, lanceolatae, deflexæ, sæpissime pubescentes. Abdomen gracile, seg-

mentis 8. Pedes sat longi, pubescentes, inermes. *Mas.* Antennæ plumosæ; artieuli usque ad duodecimum globosi; decimus tertius longissimus; deeimus quartus brevis, subconicus. *Fœm.* Antennæ pilosæ, submoniliformes; artieuli globosi; deeimus quartus crassior. Body of moderate or small size, elongate, somewhat pubescent. Eyes reniform, separate in both sexes. Mouth not elongated. Palpi four-jointed, prominent, curved, nearly cylindric; first joint much shorter than the second; second shorter than the third; fourth nearly as long as the second and the third. Antennæ fourteen-jointed, porrect, filiform, seated in a notch of the eyes. Thorax oval, convex, higher than the head. Scutellum of moderate size. Metathorax semioval, slightly gibbous, with a small longitudinal furrow. Wings narrow, elongate, lanceolate, deflexed, generally pubescent, most often ciliated along the hind border; mediastinal vein ending at beyond half the length of the wing; subcostal ending at before two-thirds of the length; radial emerging from the præbrachial transverse veinlet, ending at beyond three-fourths of the length; cubital also proceeding from the præbrachial transverse veinlet, ending at very little in front of the tip; subapical ending at very little behind the tip; subanal forming a fork of the præbraehial; anal complete; subaxillary not reaching the border. Areolets thirteen,—the humeral, the subcostal, the mediastinal, the radial, the eubital, the præbraehial, the pobraehial, the subapical, two externo-medial, the anal, the axillary, and the subaxillary; the two last partly united. Posterior margin much excavated, and forming a slightly acute angle at its base. Abdomen with eight segments, much longer than the thorax. Legs slender, moderately long, pubescent, unarmed; coxae of moderate size; unguis and onychia very small. Fore legs remote from the others, porrect, their tarsi somewhat elongated. *Male.* Antennæ plumose; joints from the first to the twelfth globose, very small; thirteenth extremely long; fourteenth short, nearly conical. Abdomen longer, more slender and more hairy than that of the female, with two small, curved, caudal appendages. Fore tarsi occasionally pilose. *Fem.* Antennæ pilose, submoniliform; joints globose; the fourteenth rather thicker than the others, sublanceolate, pubescent, more acuminate. Fore tarsi always bare.

The *Tanypi* are generally similar to the *Chironomi* in their habits. Most of the species have spotted wings; some have white and almost transparent bodies, and the delicate structure of *T. monilis* is very remarkable.

"The larva of *T. maculatus* resembles that of *Corithus plumbicornis*, but is less elongated, its head is more oval, the thorax has at its base beneath a long pediform bifid tentacle, and the tip of the abdomen is furnished with four minute triangular plates, which have two long pediform appendages beneath and two above, the latter more slender, and with long terminal hairs. It is found at all seasons of the year, the depth of winter excepted, in stagnant

waters, and keeps its body always doubled, as it were, in two, against the sides of ditches or the stalks of aquatic plants. If it is placed in a glass half-full of water, it so fixes itself against the sides of it, that its head and tail are in the water, while the remainder of the body is out of it, thus assuming the form of a siphon, the tail end being the longest. When it is disposed to feed, it lifts its head and places it horizontally on the surface of the water, so that it forms a right angle with the rest of the body, which always remains in a situation perpendicular to the surface. It then agitates, with vivacity, a couple of brushes, formed of hairs, and fixed in the anterior part of the head, which producing a current towards the mouth, it makes its meal of the various species of animalcula, abounding in stagnant waters, that come within the vortex thus produced. As it requires to be firmly fixed to the substance on which it takes its station, and its back is the only part, when it is doubled, that can apply to it, it is furnished with minute legs armed with black claws, by which it is enabled to adhere to it. It has ten of these legs: the four anterior ones, which point towards the head, and are distant from each other, are placed upon the fourth and fifth dorsal segments of the body; and the six posterior ones, which point to the anus, and are so near to each other as at first to look like one leg, are placed on the eighth, ninth, and tenth. When the animal moves, the body continues bent, and the sixth segment, which is without feet, and forms the summit of the curve, goes first. Its legs are of a nearly similar construction with those of *Helophilus pendulus*. In the interior of its thorax are two long, oval, opaque bodies, which are supposed to be air-reservoirs; these, when the animal assumes the pupa, appear to become external, and are placed on the back, precisely where the respiratory horns of aquatic pupæ are usually situated, and apparently terminate in a transparent point. The pupa is bent, like that of *Culex*, but with broader oval thoracic appendages, and small anal plates.

"The larva of *T. monilis* is found in swampy places and in ditches, is not bigger than a horsehair, and about a quarter of an inch in length. Its mode of swimming is like that of a serpent, with an undulating motion of the body, and it sometimes walks upon the bottom of the water and upon aquatic plants. It has three legs; the anterior leg is attached to the under side, towards the head, of the first segment of the body; it is long and cylindrical, placed perpendicularly or obliquely, according to the different movements the animal gives it, and terminates in two feet, armed at their extremity by a coronet of long movable hooks; these feet

are retractile within the leg, and even within the body. The two posterior legs are placed at the anal end of the body. They are similar to the fore leg, but larger, and entirely separate from each other, being not, like them, retractile within the body, but always stiff and extended; these also are armed with hooks. By the inflection of the anus the larva can give them any kind of lateral movement, except that it can neither bend nor shorten them."

The species may be grouped thus:—

*A.* Wings spotted.

- a.* Thorax with four darker stripes. Species 1–3.
- a a.* Thorax with three darker stripes. Species 4–9.
- a a a.* Thorax indistinctly striped. Species 10.

*A A.* Wings not spotted.

- a.* Thorax striped.
  - b.* Thorax with three brown stripes. Species 11, 12.
  - b b.* Thorax with three reddish or luteous stripes. Species 13–15.
  - b b b.* Thorax grey, with black stripes. Species 16.
  - a a.* Thorax not striped. Species 17.

1. **varius**, Fabr. Mant. Ins. ii. 325. 45 (1787); Gmel.; Meig.; Latr.; Fries; Mcq.; Gim.; Stæg.; Ros.; Zett. *Mas et Fœm. testaceus, thorace vittis quatuor ferrugineis, alis cinereis, fascia media maculisque albidis, halteribus albidis, femoribus, tibiis tarsisque posterioribus apice fuscescentibus; Mas, antennarum plumis et abdominis suturis fuscescentibus.* Long.  $2-2\frac{1}{2}$ ; alar. 4–5 lin.

*Testaceous.* Thorax with four ferruginous stripes. Wings grey, with whitish spots, and with a whitish middle band; veins pale, partly blackish. Halteres whitish. Legs slender, pubescent; tips of the posterior femora, tibiæ, and tarsi brownish; fore tibia longer than the fore metatarsus by one-third. *Male.* Antennæ with brownish plumes. Abdomen hairy, paler than that of the female; sutures of the segments brownish.

Generally distributed. (E. S. I.)

2. **nebulosus**, Meig. Zw. i. 57. 2 (1818); Fries; Mcq.; Curt.; Zett.; Gim.; Stæg. *Mas et Fœm. canus, thorace vittis quatuor fuscis, alis sublimpidis, macula antica apices versus strigisque marginalibus posticis cinereis, halteribus albis, abdomine nigro-cinerco, segmentis albido-marginalatis, pedibus testaceis, femoribus, tibiis et tarsorum articulis apice fuscis.* Long. 3–4; alar. 5–6 lin.

*Male and Fem.* Hoary. Thorax with four brown stripes. Wings nearly limpid, with a grey spot near the fore border at three-fourths of the length, and with grey streaks on the veins along the hind border; veins along the costa black, the rest paler. Halteres white. Abdomen blackish-grey; hind borders of the segments whitish. Legs slender, dull testaceous; tips of the femora, of the tibiæ, and of the joints of the

tarsi, brown; fore tibiæ longer than the fore metatarsi by one-half.  
*Male.* Antennæ with black plumes.

Generally distributed. (E. S. I.)

3. **choreus**, Meig. Klass. Zw. i. 23. 6 (1804); Mcq.; Stæg.; Zett.—*fasciatus*, Meig.—*sylvaticus*, Meig. *Mas et Fœm. canus, thorace vittis quatuor fuscis, alis striga apud venulam transversam nigra, fascia lata ante apicali cinerea, halteribus albidis, abdomine fusco, pedibus testaceis, tibiis et tarsorum articulis apice fuscis*; *Mas*, abdominis segmentis albido-marginatis. Long.  $1\frac{1}{2}$ —2; alar. 3—4 lin.

*Male and Fem.* Hoary. Thorax with four brown stripes. Wings clouded with grey, nearly limpid along the costa towards the base and at the tips; discal transverse veinlet clouded with black. Halteres whitish. Abdomen brown. Legs dull, testaceous; tips of the tibiæ and of the joints of the tarsi brown; fore tibiæ longer than the fore metatarsi by one-half. *Male.* Antennæ with black plumes. Hind borders of the abdominal segments whitish.

Generally distributed. Observed by Mr. Saunders in immense clouds on Wandsworth Common in the beginning of September, 1843. (E. S. I.)

4. **punctatus**, F. S. A. 43. 24 (1805); Meig.; Stæg.; Rs.; Zett.—*nebulosus*, Meig. Klass. *Mas et Fœm. albido-testaceus, thorace vittis tribus et metathorace cinereis, scutello albo, alis albidis, fasciis tribus incompletis fuscis, halteribus albis, abdomine pedibusque albidis, illius segmentis fusco-fasciatis*. Long. 3; alar. 5 lin.

*Male and Fem.* Whitish-testaceous. Thorax with three grey stripes, the middle one double, abbreviated hindward; scutellum white; metathorax grey. Wings whitish, with three irregular, incomplete, indistinct, and very pale brown bands; transverse veinlet clouded with darker brown; veins pale. Halteres white. Abdomen whitish, pilose, with a slight brown band on each segment. Legs whitish, long, and slender; fore tibiæ longer than the fore metatarsi by one-fourth; fore tarsi pilose. *Male.* Antennæ with brown plumes.

Not rare. (E.)

5. **punctipennis**, Meig. Zw. i. 61. 9 (1818); Fries; Mcq.; Gim.; Stæg.; Zett.—*cinctus*, Panz.; Latr.; Meig. Klass. *Mas et Fœm. cinereus, thorace vittis quatuor albidis tribusque fuscescentibus, alis albidis, guttis plurimis cinereis strigaque media nigricante, venis, halteribus pedibusque albis, femorum fascia subapicali, tibiis et tarsorum articulis apice nigris*. Long. 3; alar. 5 lin.

*Male and Fem.* Grey. Thorax with four whitish and three brownish stripes. Wings whitish, with numerous grey dots, and with a blackish mark by the middle of the costa; veins, halteres, and legs white; femora with a black subapical band; tibiæ and joints of the tarsi with black tips. *Male.* Antennæ with brown plumes.

Generally distributed. (E. S. I.)

6. **carneus**, F. S. A. 41. 16 (1805); Meig.; Stæg.; Zett.—*albipes*, Fries; Meig. *Mas et Fœm.* palpis, antennis, halteribus pedibusque albidis, thorace vittis tribus ferrugineis, alis albidis, fasciis tribus cinereis; *Mas*, *albidus*, abdominis suturis fuscis; *Fœm.* *rufo-testaceus*. Long.  $1\frac{1}{2}$ —2; alar.  $3\frac{1}{2}$ —4 lin.

Palpi, antennæ, halteres, and legs whitish. *Thorax with three ferruginous stripes, the middle one subdivided.* Wings whitish, with three irregular grey bands; the first a little before the middle, the second slender and interrupted, the third subapical; veins pale. Legs slender; fore tibiæ longer than the fore metatarsi by one-fourth. *Male. Body whitish.* Plumes of the antennæ pale brown. Bands of the wings indistinct. Sutures of the abdominal segments brown. *Fem. Body reddish-testaceous.*

Rare. In the British Museum. (E.)

7. **zonatus**, F. Sp. I. ii. 408. 45 (1781); Gmel.; Meig. *Mas et Fœm. albido-testaceus, thorace vittis tribus rufescensibus*, alis albidis fasciis tribus pallidissimis subobsoletis fuscescentibus, venis halteribusque albis; *Mas*, abdomine pedibusque albidis, illo fasciis fuscis; *Fœm.* abdomine pedibusque albido-testaceis. Long. 2—3; alar. 4—5 lin.

*Male and Fem. Whitish-testaceous. Thorax with three reddish stripes.* Wings whitish, with three indistinct, incomplete, very pale brown bands; veins and halteres white. Legs very slender, rather long; fore tibiæ longer than the fore metatarsi by one-fourth. *Male.* Plumes of the antennæ pale brown, white towards the tips. Abdomen whitish, hairy, with a brown band on each segment. Legs whitish. *Fem.* Abdomen and legs whitish-testaceous.

Not rare. (E.)

8. **lætus**, Meig. Zw. i. 60. 7 (1818); Fries; Zett. *Fœm. testaceus*, antennis albidis, thorace vittis tribus fuscis, metathorace cinereo, alis albidis, maculis quatuor discalibus fuscescentibus, apicibus cinereo substrigatis, venis halteribusque albidis, pedibus testaceis, femoribus fascia subapicali nigricante. Long.  $1\frac{1}{2}$ —2; alar. 4 lin.

*Fem. Testaceous.* Antennæ whitish. *Thorax with three brown stripes, the middle one subdivided;* metathorax grey. Wings whitish, with four brownish discal spots, two in front and two behind; tips slightly streaked with grey; veins and halteres whitish. Legs pale testaceous, slender; femora with a blackish subapical band; fore tibiæ longer than the fore metatarsi by one-fourth.

Rare. In the British Museum. (E.)

9. **culiciformis**, F. Sp. I. ii. 411. 64 (1781); Gmel.; Meig.; Fries; Stæg.; Zett. *Fœm. fuscus, thorace vittis quatuor albidis*, alis albidis, macula postica fasciaque subinterrupta cinereis, venis halteribus pedibusque albis. Long.  $\frac{3}{4}$ ; alar. 2 lin.

*Fem. Brown. Thorax with four whitish stripes.* Wings whitish, with a grey spot on the hind border at one-fourth of the length, and a grey

band a little beyond the middle; the band is narrower towards the hind border, and nearly interrupted in the disc; veins, halteres, and legs white.

Rare. In the British Museum. (E.)

10. **monilis**, L. F. S. 1763 (1761); F.; Gmel.; Latr.; Meig.; Fries; Mcq.; Zett.; Gim.; Stæg.—*maculatus*, D. G.; Latr. H. N. Cr. et Ins.; Meig. Klass. *Mas et Fæm.* cinereo-fuscus, thorace subvittato, alis albidis, maculis cinereis guttisque anticis nigricantibus, venis halteribus pedibusque albis, his annulis novem nigris; *Mas*, abdomine albido fasciis fuscis. Long.  $1\frac{3}{4}$ —3; alar.  $3\frac{1}{2}$ —5 lin.

*Male and Fem.* Greyish-brown. Thorax indistinctly striped. Wings whitish, with several grey spots, and in front with some blackish dots; veins, halteres, and legs white. Legs slender; femora with a black band near the tips; tibiae with three black bands; tarsi with a black band at the tip of each joint; metatarsi with a black middle band; fore tibiae longer than the fore metatarsi by one-half. *Male.* Antennæ with brown plumes. Abdomen whitish, with a brown band on each segment.

Generally distributed. (E. S. I.)

11. **plumipes?** Fries, Mon. Tan. 9. 1 (1823); Meig.; Stæg.; Zett. *Fæm. Piceus*, robustus, palpis antennisque nigris, thorace subcano vittis tribus fuscis, alis subcinereis nudis, venis halteribus pedibusque testaceis, venula transversa nigro-nebulosa. Long.  $2\frac{1}{4}$ ; alar. 4 lin.

*Fem.* *Piceous*, rather stout. Palpi and antennæ black. *Thorax with a hoary tinge, which is interrupted by three brown stripes.* Wings greyish, bare; veins testaceous; transverse veinlet clouded with black. Halteres pale testaceous. Legs testaceous, slightly pubescent, rather long and slender; fore tibiae longer by half than the fore metatarsi.

Rare. In the British Museum. (E.)

12. **notatus**, Meig. Zw. i. 58. 4 (1818); Stæg.; Zett. *Mas, canus*, palpis antennisque nigris, thorace vittis tribus fuscis, alis subcinereis pubescentibus, venis pallidis, venula transversa nigro-nebulosa, halteribus albis, abdomine albido fasciis nigricantibus, pedibus testaceis, tibiis et tarsorum articulis apice nigricantibus. Long.  $2\frac{1}{2}$ ; alar. 4 lin.

*Male.* *Hoary.* Palpi and antennæ black, the latter with brown plumes. *Thorax with three brown stripes.* Wings slightly greyish, pubescent; veins pale; discal transverse veinlet clouded with black. Halteres white. *Abdomen whitish*, pubescent, *with a blackish band on the fore border of each segment.* Legs testaceous, long, rather slender; tips of the tibiae and of the joints of the tarsi blackish; fore tibiae a little longer than the fore metatarsi.

Rare. In the British Museum. (E.)

13. **melanops**, Wied.; Meig. Zw. i. 65. 18 (1818); Mcq.; Stæg.; Rs.; Zett. D. Sc.—*Irundineti?* L.; F.; Sehr.; Gmel.—*bicolor*, Fries; Meig.; Zett. I. L. *Mas et Fæm.* pallide testaceus, palpis, antennis, halteribus pedibusque albidis, thorace vittis tribus rufescensibus, alis

*albo-limpidis* pubescentibus, venis albis apud costam testaceis. Long.  $1\frac{1}{2}$ - $2\frac{1}{2}$ ; alar. 3-5 lin.

*Male and Fem. Testaceous.* Palpi, antennæ, halteres, and legs whitish. Thorax with three reddish stripes. *Wings limpid-white*; veins white, pale testaceous along the costa.

Not rare. (E.)

14. **ferrugineicollis**, Meig. ; Meig. Zw. i. 64. 15 (1818); Meig. ; Rs.; Zett. D. Se.—*tanyopodipennis*, Fries, MSS.; Zett. I. L. *Fem.* testaceus, thorace vittis tribus rufescens pubescentibus, *alis subcinereis* pubescentibus, venis pallidis. Long.  $1\frac{1}{4}$ ; alar.  $2\frac{1}{2}$  lin.

*Fem. Testaceous.* Antennæ pubescent. Thorax with three reddish stripes. *Wings greyish*, pubescent; veins pale. Abdomen pubescent. Legs rather long and slender; fore tibiæ a little longer than the fore metatarsi.

Rare. In the British Museum. (E.)

15. **melanurus**, Meig. Zw. i. 59. 5 (1818); Zett. *Mas, albidus*, thorace vittis tribus luteis, *alis limpidis* pubescentibus, venis pallidis, *abdominis suturis apiceque fuscescentibus*. Long. 3; alar. 5 lin.

*Male. Whitish.* Antennæ with testaceous plumes. Thorax with three luteous stripes. *Wings limpid*, pubescent; veins pale. *Abdomen* pubescent; *sutures of the segments and tip brownish*. Legs slender, slightly pubescent; fore tibiæ longer than the fore metatarsi by one-fourth.

Rare. In the British Museum. (E.)

16. **pusillus**, Meig. Zw. i. 62. 11 (1818). *Niger, alis subcinereis*; *Fem. thorace einkerco vittis nigris.* Long.  $\frac{2}{3}$ ; alar.  $1\frac{1}{2}$  lin.

Black, very small. Wings greyish. *Fem.* Thorax grey, with black stripes.

Rare. In Mr. Haliday's collection. (I.)

17. **nervosus**, Hoffm.; Meig. Zw. i. 64. 14 (1818). *Fem. niger, nitens, crassus, alis sublimpidis, venis albidis apud costam fuseis, halteribus piecis, pedibus validis fulvis, femoribus tibiis tarsisque apice tibiisque antieis totis fuseis.* Long. 8; alar. 6 lin.

*Fem.* Black, shining, very stout. Antennæ black. Wings nearly limpid; subcostal, mediastinal, and radial veins, and transverse veinlets brown, the other veins whitish. Halteres piceous. Legs stout, tawny; tips of the femora, of the tibiæ, and of the tarsi, and the whole of the fore tibiæ brown.

Rare. In the British Museum. (E.)

#### Genus VI. CORYNONEURA.

CORYNONEURA, Winn. Ent. Zeit. Stett. vii. 12 (1846). *Chironomus* p., Meig.; Zett.

Corpus elongatum, minimum. Caput rotundum, antice depresso. Oculi subrotundi, intus paullulum emarginati. Proboscis brevissima. Palpi 4-articulati, incurvi; articuli primus, secundus, et tertius æquales, cylindrici; quartus fere triplo longior. Antennæ porrectæ, filiformes. Thorax ovatus, convexus, antice subproductus. Scutellum parvum, rotundum. Alæ lanceolatæ, nudæ, deflexæ; costa brevisima, in clavæ formam dilatata. Abdomen cylindricum, segmentis octo. Pedes longi; tibiæ posticæ apice incrassatæ, supra unicalcaratæ, subtus bispinosæ. *Mas.* Antennæ 9-articulatae, plumosæ; articuli octo ovati; nonus major, clavatus, apice pilis coronatus. Alarum costa circiter ad quartam partem marginis antici pertinens. Abdomen apice obtusum. *Fœm.* Antennæ 5-articulatae, pilosæ; articuli quatuor ovati; quintus elongatus, pilis brevioribus coronatus quam maris. Alarum costa ad medium marginis antici pertinens.

Body elongated, very small. Head round, flat above. Eyes nearly round, slightly emarginated on the inner side. Proboscis very short. Palpi four-jointed, curved downward; first, second, and third joints cylindrical, equally long; fourth almost as long as the other three. Antennæ porrect, filiform, standing on a thick conical base. Thorax oval, convex, slightly elongated in front. Scutellum small, round. Metathorax elevated, forming an acute angle hindward. Pectus very convex between the anterior legs. Wings lanceolate, bare, deflexed; costa clavate, very short. Halteres large. Abdomen cylindrical, with eight segments. Legs long; hind tibiæ incrassated at the tips, with a long spur on the upper side, and two short stout spines beneath. *Male.* Antennæ nine-jointed, plumose; joints from the first to the eighth oval; ninth clavate, very large, with a circlet of hairs at the tip; costa one-fourth of the length of the wing. Abdomen obtuse at the tip. *Fœm.* Antennæ five-jointed, pilose; joints from the first to the fourth oval; fifth elongated, its circlet of hairs shorter than those of the male. Abdomen acuminated at the tip.

1. **minutissima**, Meig. Zw. vii. 8. 137 (1838). *Mas, minuta*, Winn. Ent. Zeit. vii. 13.—*atra?* Winn. Ent. Zeit. xiii. 50.—*Fœm. celeripes?* Winn. Ent. Zeit. xiii. 50. *Mas, nigra*, proboscide, palpis, antennis halteribusque albido-flavis, antennis apice fuscescentibus, alis flavescentibus aut lacteis, clavo obscure flavo, abdomine viridi-albo apice fusco, pedibus fuscis, femoribus albis apice fuscis; *Fœm. flava*, antennis apice fuscis, thorace vittis tribus nigris, scutello et metanoto nigris, pectora nigro-fusco, alis albidis, halteribus albis, abdomine nigro incisuris albidis, ventre sordide flavo apice nigro, pedibus albidis, articulis apice obscuris. Long.  $\frac{1}{4}$ — $\frac{5}{6}$ ; alar.  $\frac{1}{2}$ — $\frac{5}{6}$  lin.

*Male.* Head and thorax black. Proboscis, palpi, antennæ, and halteres whitish-yellow; the last joints of the antennæ brownish. Wings yellowish; the clavus dark dingy yellow. Abdomen greenish-white; the last three segments, or only the tip, brown. Legs brown; femora white, with brown tips. Var. Pleurae dingy yellow. Wings with milk-white gloss. Abdomen dark brown. *Fœm.* Head black. Palpi yellow.

Antennæ yellow; last joint brown. Thorax yellow. Mesonotum with three very broad black stripes, occupying almost the whole breadth; the lateral pair abbreviated before, the middle one extending from the pronotum to the black scutellum. Metanotum black. Pectus black-brown. Wings with whitish gloss. Halteres white. Abdomen black, with narrow whitish incisures; under side dingy yellow, with the two last segments black. Legs whitish; tips of the joints, and three last joints of the hind tarsi brown.

Common from May to September about lakes and river. Runs about in curves and circles with great rapidity on the large stones on the banks. (E. S. I.)

2. **atomaria?** Zett. Dipt. Scand. ix. 3522. 40 (1850). *Mas*, atra, alis albis, elavo fusco basi pallido, venis halteribus pedibusque albidis; *Fem.* flava, fronte verticale nigro-fuseis, thoraeis vittis tribus, scutello et metanoto fuscis, scutelli basi flavo, alis flavescensibus, elavo basi pallido apice fuso, halteribus pedibusque pallidis, abdomine fasciis pallide fuseis. Long.  $\frac{5}{12}$ ; alar.  $\frac{5}{6}$  lin.

*Male.* Deep black. Wings white; clavus brown, pale at the base; veins, halteres, and legs whitish. *Fem.* Yellow. Front and vertex blackish-brown. Whorl of the last joint of the antennæ very short. Mesonotum with three brown stripes, the middle one behind, the others before, abbreviated. Scutellum and metanotum brown, the former yellow at the base. Wings yellowish; elavus pale at the root, black-brown at the end. Halteres and legs pale. Abdomen with light brown bands on the hind borders of the segments.

Not rare about ponds, etc. (E. I.)

*Obs.* *Corynoneura scutellata*, Winn. (Ent. Zeit. Stett. vi. 13 (1846),) seems to differ from this in having a costal clavus like that of the preceding species. *Chironomus minutus*, Zett. (Dipt. Scand. 3522. 39), is probably a *Corynoneura*, differing from *C. minutissima*, the female being blackish, like the male.

#### Genus IV. CERATOPOGON.

CERATOPOGON, Meig. Klass. i. (1804); Wied.; Panz.; Meq.; Gim.; Zett.; Staeg.; Rs.; Winn. *Culex* p., L.; F.; Gmel.; Meig. Klass.; Lam. *Tipula* p., Gmel. *Chironomus* p., F.; Latr. *Trichocera*, Lam. *Culicoides*, Latr. *Palpomyia*, Meg. *Serromyia*, Meg. *Forcipomyia*, Meg. *Sphaeromias*, Steph.; Curt.; Hal. *Labidomyia*, Steph.

Corpus parvum aut minimum, pilosum aut nudum. Caput anticum saepissime depresso. Oculi lunati, subreniformes. Proboscis porrecta, plus minusve produeta, labro, lingua et maxillis cornis acuminatis. Palpi 4-articulati. Antennæ 13-articulatæ, filiformes;

- b b b.* Ungues without bristly hairs or onychia. One of the unguis (in the female only?) longer than the other. First tarsal joint longer than the second. Subcubital vein united to the cubital between the middle of the costa and the tip of the wing. Species 46.
- a a.* Wings quite bare. Subcostal vein united to the costal between the middle of the fore border and the tip of the wing.
- b.* Femora unarmed.
- c.* Ungues not denticulated.
- d.* Ungues of both sexes of equal length. Species 47, 48.
- d d.* Ungues of equal length, with a short claw by them in the female. Species 49.
- d d d.* With a claw in the female longer than the others. Species 50–53.
- c c.* Ungues (in the female only?) with a tooth on the inner side. Ungues of equal length. Species 54.
- b b.* Some, or all the femora, spinose on the under side.—*Palpomyia*, Megerle.
- c.* Ungues without spines.
- d.* Ungues of equal length in both sexes. Plantæ hairy. Species 55–58.
- d d.* One of the unguis longer than the other in the female. Plantæ hairy. Species 59.
- c c.* Ungues (of the female only?) with some spines on the inner side. Ungues of equal length.
- d.* Plantæ hairy. Species 60–63.
- d d.* Plantæ spinose.—*Sphaeromias*, Steph.; Curt. Species 64, 65.
- b b b.* Hind femora incrassated, spinose beneath. Ungues without spines. One claw longer than the others.—*Serromyia*, Meg. —*Prionomyia*, Steph. Species 66.
- A A.* Wings with one cubital areolet, produced from the præbrachial to the costa. Wings bare. Subcostal vein united to the costal between the middle of the fore border and the tip of the wing.
- a.* Femora simple.
- b.* Ungues without spines. Species 67–70.
- b b.* Ungues with a spine on the inner side. Species 71.
- b b b.* Ungues with a small claw beneath. Plantæ spinose. Sp. 72.
- a a.* Some, or all the femora, spinose on the under side.
- b.* Ungues without spines. Species 73–76.
- b b.* Ungues of the female with a spine on the inner side. Species 77–81.
- A A.* Antennæ with the three last joints elongated. Species 82.

The species of *Ceratopogon* generally require to be well preserved and displayed, and highly magnified, in order to identify them with the characters by which Winnertz has described them,

and divided them into minor groups; these characters are mostly unnoticed by Meigen and by Zetterstedt. Their delicate structure is very easily injured, and I have not been able to ascertain clearly that all the species here described are British insects; but it is most probable that they will prove to be so.

1. **pallidus**, Winn. ! Linn. Ent. vi. 15. 1. pl. 3. f. 1 (1852). *Mas et Fœm. fusco-cinereus*, pallide aureo-hirtus, palpis fuscis, *thoracis lateribus albido-lineatis*, pectore antico albo, halteribus fuscis basi albidis; *Mas*, antennarum fasciculis nigro-cinereis apice albicantibus, *alis limpidis albicantibus* cano-hirtis, venis pallidis ad costam fuscescentibus, pedibus albidis albo-hirtis; *Fœm.* antennarum articulis primo ad octavum albidis longiovatis, nono ad decimum tertium pallide fuscescentibus, *alis limpidis nigro-cinereo-hirtis*, pedibus flavescentibus flavidо-hirtis. Long. 1; alar. 2 lin.

*Male and Fem.* Brownish-cinereous, clothed with pale gilded yellow hairs. Palpi brown. *Thorax with a whitish stripe on each side.* Pectus white in front. Halteres brown, whitish towards the base. *Male.* Pencils of the antennæ blackish-cinereous, with whitish reflections at the tips. *Wings whitish-limpid*, clothed with hoary hairs; veins pale, brownish towards the costa. Legs whitish, clothed with white hairs. *Fem.* Joints of the antennæ from the first to the eighth whitish, elongate-oval, from the ninth to the thirteenth pale brown. *Wings limpид*, with blackish-grey hairs. Legs yellowish, with yellowish hairs.

(E.?)

2. **regulus**, Winn. ! Linn. Ent. vi. 16. 2. pl. 3. f. 2 (1852). *Mas et Fœm. niger, aureo-flavo-hirtus* nigroque setosus, pectoris lateribus anticus albo-unipunctatis, halteribus niveis, abdomine flavo-cinereo-hirto, genubus argenteo-punctatis, tibiis tarsisque piceis; *Mas*, antennarum fasciculis apice albicantibus, *alis albis* albo-hirtis, costa nigro-setosa; *Fœm. alis limpidis nigro-cinereo-hirtis*, femoribus tibiisque posticis non-nihil incrassatis. Long.  $\frac{2}{3}$ - $\frac{5}{6}$ ; alar.  $1\frac{1}{3}$ - $1\frac{2}{3}$  lin.

*Male and Fem.* Black, clothed with gilded yellow hairs and with black bristles. Palpi black. Tips of the antennæ with whitish reflections. Pectus in front of the wings with a white dot on each side. Halteres snow-white. Abdomen black or blackish-brown, clothed with long yellowish-grey hairs. Knees with a silvery dot. Tibiae and tarsi piceous. *Male.* Plumes of the antennæ with whitish tips. *Wings white*, clothed with white hairs; costa with black bristles. *Fem.* *Wings limpид*, with blackish-grey hairs. Hind femora and hind tibiae somewhat thickened.

(E.?)

3. **niger**, Winn. ! Linn. Ent. vi. 17. 3. pl. 3. f. 3 (1852). *Mas et Fœm. niger, nigro-hirtus*, halteribus albis petiolo nonnunquam fuscente, abdomine cano-piloso nonnunquam nigro-fusco, pedibus piceis,

*Male and Fem. Black. Thorax blackish-grey, clothed with short yellow and long black hairs.* Scutellum with black hairs. Sides of the pectus in front, and fore pectus, with dingy-white marks. Wings whitish; their hairs grey, brownish in front; veins pale, brown towards the costa. Halteres white. Abdomen and legs blackish-brown, clothed with long blackish-grey or almost black hairs. Femora and tibiæ rather thick; tarsi a whitish-yellow, with blackish-brown tips. *Male.* Plumes of the antennæ with glistening-white tips. *Fem.* Antennæ yellowish; the five apical joints brown.

Not common. (E.)

9. **lepidus**, Winn. ! Linn. Ent. vi. 23. 9. pl. 3. f. 7 (1852). *Mas, niger, capite postico nigro-hirto, autennarum plumis apice albo-nitentibus, thorace subnitido submetallico-viridi aurato-hirto nigro-setoso, pectoris lateribus obscure piceis, alis hyalinis cano-pilosis, venis fuscescentibus apud costam nigro-fuscis, halteribus albis nigro-petiolatis, abdome nigro-fusco, pilis longis albo-flavis, pedibus piceo-fuscis, femoribus tibiisque vix incrassatis, tarsis albidis albo-flavo-pilosis, articulis apice fuscis.* Long. 1; alar. 2 lin.

*Male. Black.* Hind part of the head with black hairs. Plumes of the antennæ glistening-white towards the tips. *Thorax slightly shining, with a tinge of metallic green,* clothed with gilded hairs; sides, shoulders, and border of the scutellum with long black bristles; sides of the pectus piceous, dull. Wings hyaline, appearing whitish on a dark ground, clothed with hoary down; veins brownish, blackish-brown towards the costa. Halteres black, with white knobs. Abdomen blackish-brown, clothed with long whitish-yellow hairs; under side with grey, yellowish-glistening. Legs piceous-brown; femora and tibiæ hardly incrassated; tarsi whitish, clothed with whitish-yellow hairs, their joints with brown tips.

(E.?)

10. **brevipennis**, Mcq. H. N. D. i. 123. 7 (1834); Meig.; Winn. ! Linn. Ent. vi. pl. 3. f. 10. *Mas et Fæm. niger, nitidus, pectoris lateribus pectoreque antico flavo-albo-notatis, thorace pilis nonnullis nigris, alis albidis cano-pilosis, venis pallide fuscis apud costam obsecurioribus, abdomine pilis longis densis nigris vestito, pedibus nigro-hirtis, tarsis nonnunquam pallidis; Mas, antennarum plumis apice albidis; Fæm. alis abbreviatis, pilis densioribus obsecurioribus, abdomine lato.*

*Male and Fem. Black, shining.* A little dingy whitish-yellow tuft on each side of the pectus, before the wings, and on the fore pectus. *Thorax thinly covered with black hairs.* Wings whitish, with hoary hairs; veins pale brown, darker towards the costa. Abdomen thickly clothed with long black hairs. Legs with black hairs, occasionally piceous; tarsi often tawny or yellow. *Male.* Plumes of the antennæ glistening-white towards the tips. *Fem.* Joints of the antennæ from the first to the eighth cylindrical, from the ninth to the thirteenth oval, the latter with white-glistening hairs. Wings obtuse oval, shorter and

broader than those of the male, their hairs darker and thicker. Abdomen broad.

(E.)

11. **tenuis**, Winn.! Linn. Ent. vi. 25. 11. pl. 4. f. 11 (1852). *Mas, nigro-cinereus, nigro-hirtus, antennarum plumis apice albidis, thorace subobscuro, alis albidis cinereo-hirtis, venis pallidis apud costam fuscis, halteribus albis, petiolis nigricantibus, abdomine nigro-fusco, pedibus nigris subnitidis, tarsis flavido-albis apice fuscescentibus.*

*Male. Blackish-grey, clothed with black hairs. Head and palpi black. Plumes of the antennæ glistening-white towards the tips. Thorax hardly shining. Wings whitish, with grey hairs; veins pale, brown towards the costa. Halteres blackish, with white knobs. Abdomen blackish-brown, with some short white hairs amongst the long black hairs on the back. Legs black, somewhat shining, clothed with black hairs; tibiæ slightly incrassated; tarsi yellowish-white, with more or less brown tips.*

(E.?)

12. **divaricatus**, Winn.! Linn. Ent. vi. 25. 12. pl. 4. f. 12 (1852). *Mas, ater, antennarum plumis apice albidis, thorace nitido nudo lato, pectoris lateribus flavido-notatis, alis hyalinis subalbidis cinereo-pilosis, venis pallidis apud costam fuscis, halteribus albis, abdomine nigro-fusco cinereo-piloso, ventre fulvo, pedibus pallide fuscescentibus, tarsis subalbidis, articulis apice nigris. Long.  $\frac{2}{3}$ ; alar.  $1\frac{1}{3}$  lin.*

*Male. Deep black. Plumes of the antennæ glistening-white towards the tips. Thorax broad, bare, shining. A little dingy yellowish tuft on each side of the pectus before the wings. Wings hyaline, somewhat whitish, with grey hairs; veins pale, brown towards the costa. Halteres white. Abdomen blackish-brown, thinly covered with grey hairs; under side tawny. Legs pale brown; tarsi more whitish.*

(E.?)

13. **alacer**, Winn.! Linn. Ent. vi. 25. 13. pl. 4. f. 13 (1852). *Mas, ater, antennarum plumis apice albidis, thorace nitido pilis nigris, alis hyalinis cano-pilosis, venis pallidis apud costam fuscescentibus, halteribus sordide albis fusco-petiolatis, abdomine nigro-fusco, pilis longioribus canis, pedibus pallidis subpiceis, tarsis pallidioribus. Long.  $\frac{2}{3}$ ; alar.  $1\frac{1}{3}$  lin.*

*Male. Deep black. Plumes of the antennæ glistening-white towards the tips. Thorax clothed with black hairs, with a greyish tinge in some aspects. Wings hyaline, whitish when seen on a dark surface, with grey white-glistening hairs; veins pale, distinct, brownish towards the costa. Halteres brown, with dingy white knobs. Abdomen almost blackish-brown, with rather long grey white-glistening hairs. Legs pale, somewhat piceous; tarsi paler than the other parts.*

(E.)

14. **murinus**, Winn.! Linn. Ent. vi. 26. 14. pl. 4. f. 14 (1852).

*Mas, fusco-niger, palpis nigris, antennarum plumis nigris apice albidis, thorace nitido, alis hyalinis, apice pubescentibus, venis pallidis distinctis apud costam fuscis, halteribus sordide albo-flavis, abdominis apice cano-pubescente, pedibus albido-flavis albido-hirtis.* Long.  $\frac{2}{3}$ ; alar.  $1\frac{1}{4}$  lin.

*Male. Brownish-black. Palpi black. Plumes of the antennæ black, glistening-white towards the tips. Thorax shining, with a glistening grey hue in some aspects. Wings hyaline, glistening milk-white when seen on a dark surface, with a few little hairs near the tips; veins pale, but distinct, brown towards the costa. Halteres dingy whitish-yellow. Abdomen blackish-brown, with short hoary down at the tip. Legs whitish-yellow, with short whitish hairs.*

(E.?)

21. **forcipatus**, Winn.! Linn. Ent. vi. 30. 21. pl. 4. f. 21 (1852).  
*Mas, nigro-fuscus, palpis nigris, antennarum plumis apice flavescentibus, thorace subnitido flavescente-hirto, alis hyalinis nudis, halteribus lacteis, petiolis flavescentibus, abdomine obscuro fusco-piloso apice obtuso forcipibus maximis fusco-flavis, pedibus fuscescente-flavis.* Long.  $\frac{2}{3}$ ; alar.  $1\frac{1}{4}$  lin.

*Male. Blackish-brown. Palpi black. Plumes of the antennæ glistening-yellowish towards the tips. Thorax somewhat shining, with yellowish hairs, which appear yellowish-grey in some aspects. Wings limpid, bare. Halteres yellowish, with milk-white knobs. Abdomen dull, with brown hairs, glistening-whitish towards the tip, which is obtuse, and is furnished with a pair of very large brownish-yellow forceps. Legs brownish-yellow.*

(E.?)

22. **lucorum**, Meig. Zw. i. 72. 9 (1818); Mcq.; Winn.! Linn. Ent. vi. pl. 4. f. 22. *Mas et Fœm. fuscus aut nigro-fuscus, albido-hirtus, thorace subnitido, alis hyalinis, venis pallidis apud costam paullo obscurioribus, halteribus niveis, pedibus flavescentibus aut ferrugineis albo-hirtis; Mas, alis apice pubescentibus; Fœm. alis fere totis pubescentibus.* Long.  $\frac{2}{3}$ - $\frac{3}{4}$ ; alar.  $1\frac{1}{2}$  lin.

*Male and Fem. Black or blackish-brown, clothed with whitish hairs. Thorax somewhat shining, its hairs appearing grey in some aspects. Wings hyaline; veins pale but distinct, rather darker towards the costa. Halteres snowy-white; their petioles generally brownish. Legs yellowish or ferruginous, clothed with white hairs. Male. Wings appearing milk-white in a shaded aspect, pubescent towards the tips. Fem. Wings almost wholly pubescent.*

Not rare. (E.)

23. **rostratus**, Winn.! Linn. Ent. vi. 31. 23. pl. 4. f. 23 (1852).  
*Mas et Fœm. cinereo-fuscus, proboscide elongata, antennarum pilis apice albo-nitentibus, thorace flavo-hirto, scutello setis nonnullis nigris ciliato, pectoris lateribus abdomineque nigro-fuscis, hoc cinereo-hirto, alis hyalinis, venis pallidis apud costam fuscis, halteribus lacteis, petiolis fuscescentibus, pedibus ferrugineis; Mas, antennis nigro-fuscis, alis nudis; Fœm. antennis fuscis, alis apices versus subpilosis.* Long.  $\frac{3}{4}$ -1; alar. 2 lin.

*Greyish-brown. Proboscis elongated. Thorax slightly clothed with*

*short yellow hairs. Scutellum fringed with a few black bristles. Wings hyaline; veins pale, brown towards the costa. Halteres brownish, with milk-white knobs. Abdomen clothed with grey hairs, which are long towards its tip. Legs ferruginous. Male. Antennæ and their plumes blackish-brown, the latter glistening-white towards their tips. Wings bare. Fem. Antennæ brown, the eight basal contracted cylindrical joints with grey hairs, the five long elliptical joints with whitish hairs. Wings somewhat hairy towards the tips.*

Not rare. (E.)

24. **brunnipes**, Meig. Zw. i. 71. 7 (1818); Stæg.; Zett.; Winn.! Linn. Ent. vi. pl. 5. f. 24. *Mas et Fœm. nigro-fuscus, thorace subnitido pilis flavescentibus, scutello setis nonnullis nigris, alis subcinereis, venis apud costam nigro-fuscis, halteribus lacteis, abdomine nigro-fusco obscuro cano-piloso, pedibus ferrugineis; Mas, antennarum pluma nigra apice vix albo-micante, alis nudis; Fœm. pallidior, antennis fuscis nigro-hirtis, alis apices versus pubescentibus. Long.  $\frac{3}{4}$ -1; alar. 2 lin.*

*Male and Fem. Blackish-brown. Thorax slightly shining, clothed with yellowish hairs, which appear brown in some aspects. Scutellum with some black bristles. Wings greyish; veins towards the costa blackish-brown, the rest paler. Halteres milk-white. Abdomen blackish-brown, dull, clothed with hoary hairs. Legs ferruginous. Male. Plumes of the antennæ black, slightly glistening-white at the tips. Wings bare. Fem. Paler than the male. Antennæ brown, with black hairs; joints from the first to the eighth nearly oval, the five following elongate-elliptical, their hairs glistening-hoary. Wings pubescent towards the tips.*

Not rare. (E.)

25. **pavidus**, Winn.! Linn. Ent. vi. 33. 25. pl. 5. f. 25 (1852). *Mas et Fœm. nigro-fuscus, subnitidus, thorace pilis nonnullis nigris vestito, alis hyalinis, venis pallidis, abdomine pilis fuscis albido-nitentibus vestito; Mas, venis apud costam pallide fuscescentibus, halteribus fuscis, capitulis sordide albis, femoribus tibiisque ferrugineis apice fuscis, tarsis pallidioribus; Fœm. venis apud costam halteribusque fuscis, pedibus flavis. Long.  $\frac{1}{2}$ - $\frac{3}{5}$ ; alar. 1 lin.*

*Male and Fem. Blackish-brown, slightly shining. Thorax of a dull greyish hue when seen in some aspects, almost bare, with very few short black hairs, and with some longer black hairs on the border of the scutellum. Wings hyaline, pubescent at the tips; discal veins pale. Abdomen clothed with brown whitish-glistening hairs. Male. Veins towards the costa pale brownish. Halteres dingy-white, with brown petioles. Femora and tibiæ ferruginous, with brown tips; tarsi paler. Fem. Veins towards the costa and halteres brown. Legs yellow.*

(E.?)

26. **fuscus**, Meig. Zw. i. 71. 6 (1818); Zett.; Winn.! Linn. Ent. vi. pl. 5. f. 26. *Mas, niger, antennarum plumis nigro-fuscis apice flavidis, thorace nitido pilis flavidis, alis hyalinis nudis, venis pallidis apud*

spots. *Halteres white.* *Abdomen blackish-brown*, clothed with greyish hairs, which are longer than those of the thorax. *Legs pale brown*; *femora and tibiæ with a white ring near the knees, which are black*; *tibiæ sometimes with dark tips*; *tarsi whitish*. *Male.* Plumes of the antennæ brown, glistening-white towards the tips. Second joint of the tarsi slender. *Fem.* Second joint of the tarsi stout, almost oval. Antennæ brownish, darker towards the tips; joints from the first to the eighth oval, the five last long, elliptical. Wings pubescent, darker than those of the male; veins distinct, blackish-brown towards the costa.

Rare. (E.)

33. ***arcuatus***, Winn.! Linn. Ent. vi. 39. 33. pl. 5. f. 33 (1852). *Mas et Fœm. flavo-cinereus, palpis fusco-flavis, scutello flavo aut flavo-marginato, alis cinereis maculis nonnullis magnis limpidis parvisque fuscis, halteribus albis, abdomine obscure fusco, pedibus pallidis, genubus tibiisque apice nigro-punctatis; Mas, antennarum plumis auratis; Fœm. antennis albidis apice fuscescentibus.* Long.  $\frac{2}{3}$ — $\frac{3}{4}$ ; alar.  $1\frac{1}{2}$  lin.

*Male and Fem. Yellowish-cinereous.* *Palpi brownish-yellow.* *Scutellum yellow, or with a yellow border.* *Wings grey, pubescent, limpid at the base, and adorned with some large limpid spots and with a few small brown spots.* *Halteres white.* *Abdomen dark brown, sometimes yellowish at the base and beneath in the living insect.* *Legs pale, with little black dots on the knees and on the tips of the tibiæ.* *Male.* Plumes of the antennæ gilded-brown. *Fem.* Antennæ whitish, pale brown towards the tips, clothed with whitish hairs; joints from the first to the eighth oval, from the ninth to the thirteenth elongate-elliptical. Wings much darker than those of the male.

Not common. (E.)

34. ***pūlicaris***, Linn. F. S. 1892 (1767); F.; Gmel.; Meig.; Meq.; Dahlb.; Staeg.; Zett.; Rs.; Winn.! Linn. Ent. vi. pl. 5. f. 34.—*punctata*, Latr.; Panz. *Mas et Fœm. cinereus, palpis fuscis, thorace vittis duabus lateralibus obscure fuscis, alis albis fusco-guttatis, halteribus albis, abdomine nigro-fusco, suturis sèpissime albidis, pedibus pallide fuscis, tibiis posticis basi albidis, tarsorum articulis apice obscuris; Mas, antennarum plumis flavido-fuscis auratis; Fœm. antennis fuscescentibus.* Long.  $\frac{2}{3}$ —1; alar.  $1\frac{1}{2}$ —2 lin.

*Grey.* *Palpi brown; first joint slender.* *Thorax with a dark brown stripe on each side in front of the wings.* *Pectus and scutellum brown.* *Wings white, with brown dots, of which three along the costa are larger and darker than the others.* *Halteres white.* *Abdomen blackish-brown; sutures of the segments generally whitish.* *Legs pale brown; hind tibiæ whitish at the base; tarsi paler, their joints with dark tips.* *Male.* Plumes of the antennæ yellowish-brown, gilded. *Fem.* Antennæ brownish; joints from the first to the eighth oval, from the ninth to the thirteenth elongate-elliptical.

Generally distributed. Very abundant and annoying in marshy places. (E. S. I.)

35. **albicans**, Winn. ! Linn. Ent. vi. 41. 35. pl. 6. f. 35 (1852).  
*Mas et Fœm. cinereus, palpis flavis, thorace albo-piloso setis nonnullis nigris, alis albis, venis pallidis, halteribus albis, abdomine albo-hirto, pedibus pallide flavescensibus cano-hirtis, femoribus tibiisque apice nigris; Mas, antennarum plumis fuscis auratis apice albidis, alis ex parte pubescentibus, abdomine fusco; Fœm. antennis albidis, thorace flavo-cinereo, alis totis pubescentibus, abdomine albido.* Long.  $\frac{1}{2}$ - $\frac{2}{3}$ ; alar.  $1-1\frac{1}{3}$  lin.

*Male and Fem. Grey*, clothed with white hairs. *Palpi yellow. Wings white*, with some white hairs; veins pale. *Halteres white. Legs pale yellowish*, with grey white-glistening hairs; *femora and tibiæ with black tips. Male. Plumes of the antennæ gilded-yellow*, glistening-white at the tips. *Wings partly pubescent. Abdomen brown. Thorax with a few black bristles. Fem. Antennæ whitish*; joints from the first to the eighth oval, from the ninth to the thirteenth elongated-elliptical. *Thorax yellowish-grey*, without black bristles. *Wings wholly pubescent. Abdomen whitish.*

Not common. (E.)

36. **aestivus**, Winn. ! Linn. Ent. vi. 42. 36. pl. 6. f. 36 (1852).  
*Fœm. nigro-cinereus, palpis antennisque nigris, his nitidis apice albidis, thorace obscuro dorso cinereo vittis quinque nigris, scutello fulvo, alis albicantibus, venis pallidis apud costam fuscis, halteribus fuscis, capillulis sordide albis, abdomine nigro-fusco obscuro, pedibus piceis, tarsis flavido-albis, articulis apice obscuris.* Long.  $\frac{2}{3}$ ; alar.  $1\frac{1}{3}$  lin.

*Fem. Blackish-grey. Palpi black. Antennæ shining black; joints from the first to the eighth oval, from the ninth to the thirteenth elliptical, glistening-white. Thorax dull; dorsum glistening-grey, with five stripes, the middle one very slender, the outermost pair broadest. Scutellum tawny. Wings whitish; veins pale, brown towards the costa. Halteres brown, with dingy-white knobs. Abdomen blackish-brown, dull. Legs piceous; tarsi yellowish-white, their joints with dark tips.*

Not common. (E.)

37. **cunctans**, Winn. ! Linn. Ent. vi. 42. 37. pl. 6. f. 37 (1852).  
*Fœm. murinus, flavidus-pilosus, palpis antennisque fuscis, his pilis verticillatis flavidis albo-nitentibus, pectoris lateribus nigricantibus cano-nitentibus, alis hyalinis cinereo-hirtis, venis pallidis apud costam fuscescentibus, halteribus albis, abdomine nigro obscuro cano-piloso, pedibus pallide piceis, tarsis albidis basi piceis, articulis apice fuscis.* Long.  $\frac{2}{3}$ ; alar.  $1\frac{1}{3}$  lin.

*Fem. Mouse-colour, clothed with yellowish hairs. Palpi and antennæ brown*, the latter with yellowish white-glistening verticillate hairs; joints from the first to the eighth oval, from the ninth to the thirteenth elongate-elliptical. *Sides of the pectus blackish, with a glistening hoary hue. Wings hyaline, with grey hairs; veins pale, brownish towards the costa. Halteres white. Abdomen black, dull, with short hoary hairs. Legs pale piceous; second, third, fourth, and fifth joints of the tarsi whitish, with brown tips.*

(E. ?)

ninth to the thirteenth elongated-elliptical. Thorax with a few black bristles. *Wings hyaline*, whitish when seen on a dark surface, with hoary hairs; veins pale; costal veins with brownish tips. *Halteres white*. *Abdomen brown, pale beneath, flesh-colour in the living insect*, thickly covered with short whitish hairs. *Legs pale; knees blackish*.

Not common. (E.)

44. **neglectus**, Winn.! Linn. Ent. vi. 46. 44. pl. 6. f. 44. (1852).  
*Mas, obscure fuscus, palpis antennisque nigris*, harum plumis nigris apice albidis, thorace nigro-hirto, alis *hyalinis nigro-pilosus*, venis pallidis apud costam nigris, *halteribus nigro-fuscis, abdomine nigro-fusco, pedibus pallide piceis, tarsis albidis articulis apice fuscis*. Long.  $\frac{2}{3}$ ; alar.  $1\frac{1}{4}$  lin.

*Male. Palpi black; first joint long; second short, almost cylindrical. Antennæ black, with black plumes, whose tips are glistening-white. Thorax dark brown, dull, with a whitish glistening in some aspects, clothed with black hairs. Wings hyaline, whitish when seen on a dark surface, with black hairs; veins pale, black towards the costa. Halteres blackish-brown; their knobs with almost grey tips. Abdomen blackish-brown, with black, hoary-glistening hairs. Legs pale piceous; tarsi whitish, their joints with dark tips.*

Not common. (E.)

45. **splendidus**, Winn.! Linn. Ent. vi. 47. 45. pl. 6. f. 45 (1852).  
*Mas, albo-flavus, antennis auratis, pectore et scutello albis, alis pallide fusco-flavis guttis duabus anticis et sex posterioribus nigris marginibus apices versus pilosis, halteribus albis, abdomine atro segmentorum marginibus niveis, pedibus albidis cingulis nigris*. Long.  $\frac{3}{5}$ ; alar. 1 lin.

*Male. Proboscis and palpi yellowish-white. Antennæ and their plumes gilded-yellow; tips of the latter tinged with brown; hind head hoary; vertex silvery-white. Thorax whitish-yellow, inclining to brown, finely punctured with brown. Pectus, scutellum and metathorax white. Wings pale brownish-yellow, appearing white on a dark surface, pubescent along the apical half of the border, with eight black dots,—two on the veins by the costa, two in the disc, and four in a row hindward from half the length of the border to the tips of the wing. Halteres white. Abdomen deep black, with slight snow-white bands on the hind borders of the segments; the four last segments appearing wholly white in some aspects. Legs whitish; tips of the femora, of the tibiæ, and of the joints of the tarsi with black bands; hind tarsi wholly black; fore tibiæ with a brown subapical band; hind tibiæ with two brown bands.*

(E.?)

46. **ochraceus**, Winn.! Linn. Ent. vi. 48. 46. pl. 6. f. 46 (1852).  
*Mas, ochraeo-flavus, palpis apiee fuseeentibus, antennis fuscis, alis limpidis nudis apiees versus pubeseentibus, venis distinctis plus minusve fusceenteibus apud eostam apiee inerassatis, pedibus pallidioribus*. Long.  $\frac{3}{4}$ ; alar.  $1\frac{1}{2}$  lin.

*Male. Ochraceous-yellow. Palpi with brownish tips. Antennæ brown; joints elliptical; ninth and the four following much elongated.*

Wings limpid, bare, pubescent towards the tips; veins distinct, more or less brownish, those towards the costa with incrassated tips. Legs paler than the body; one of the unguis about twice the length of the other.

Not rare. (E.)

47. **vitiosus**, Winn. ! Linn. Ent. vi. 49. 47. pl. 6. f. 47 (1852).  
*Mas et Fœm. obscure nigro-cinereus, palpis fuscis, antennis nigris, alis flavescentibus aut albidis, venis fuscis, halteribus albis, pedibus albidis, genubus posticis nigris; Mas, antennarum plumis apice albidis.* Long.  $\frac{1}{3}$ ; alar.  $\frac{2}{3}$  lin.

*Male and Fem. Dull blackish-grey. Palpi brown. Antennæ black. Wings appearing yellowish in the light, whitish when seen on a dark surface; veins brown. Halteres white. Legs whitish; hind knees black. Male. Plumes of the antennæ black, glistening-whitish towards the tips. Fem. Joints of the antennæ from the first to the third cylindrical; from the fifth to the eighth more oval; from the ninth to the thirteenth elongated, elliptical.*

(E.?)

48. **lacteipennis**, Zett. I. L. 820. 4 (1840); Winn. ! Linn. Ent. vi. pl. 6. f. 48. *Mas et Fœm. niger, antennis nigro-fuscis, thorace vix nitido, alis lacteis, venis albidis, halterum capitulis lacteis, femoribus tibiisque piceis aut fuscescentibus apice obscurioribus, tarsis albidis articulis apice nigris; Mas, antennarum plumis nigro-fuscis apice albidis.* Long.  $\frac{1}{2}$ ; alar. 1 lin.

*Male and Fem. Black. Antennæ blackish-brown. Thorax hardly shining. Wings milk-white; veins whitish. Halteres with milk-white knobs. Legs piceous, or brownish; tips of the femora and of the tibiæ darker; tarsi whitish, their joints with black tips; hind tarsi occasionally piceous. Male. Plumes of the antennæ blackish-brown, with glistening-white tips. Fem. Joints of the antennæ from the first to the third cylindrical; from the fifth to the eighth more oval; from the ninth to the thirteenth elongated, elliptical.*

Not common. (E.)

49. **nitidus**, Meq. H. N. D. i. 64. 2 (1834); Meig.; Stæg.; Zett.; Winn. ! Linn. Ent. vi. pl. 7. f. 49. *Mas et Fœm. niger, nitidus, facie, proboscide palpisque nigro-fuscis, thorace atro, alis limpidis sublanceolatis, venis pallidis apud costam fuscescentibus, halteribus nigris petiolis flavescentibus, pedibus fulvis nigro-variis; Mas, antennarum plumis apice albidis, unguibus parvis; Fœm. unguibus longissimis.* Long.  $1\frac{1}{4}$ - $1\frac{2}{3}$ ; alar.  $2\frac{1}{2}$ -3 lin.

*Male and Fem. Black, shining. Face, proboscis, and palpi blackish-brown. Thorax deep black. Wings limpid, almost lanceolate; veins pale, brownish towards the costa. Halteres with yellowish petioles. Abdomen with the first and second segments more or less semitransparent, tawny. Legs tawny, more or less varied with black; first and second joints of the tarsi whitish with black tips; third, fourth and fifth*

thorax; the first (large oblate sphæroidal) joint and the base of the second dingy yellowish. Vagina dingy yellowish. Ungues unequal, the longer nearly as long as the claw-joint.

Found at Holywood. Not very rare in open groves. (I.)

*Obs.* *C. gracilis*, Winn., has no relation to this species.

54. **candidatus**, Winn.! Linn. Ent. vi. 57. 53. pl. 7. f. 53 (1852).  
*Fœm.* ater, obscurus, palpis antennisque nigris, his nigro-hirtis, alis niveis, venis pallide fuscescentibus, halteribus niveis, pedibus nigro-fuscis, tarsorum articulis primo et secundo albis. Long. 1; alar. 2 lin.

*Fem.* Deep black, not shining. Palpi black. Antennæ black, with black verticillate hairs, which are glistening-white on the apical joints; joints from the first to the eighth cylindrical; from the ninth to the thirteenth elongated, oval. Wings and halteres snowy-white; veins pale brownish. Legs blackish-brown; first and second joints of the tarsi white.

(E.?)

55. **flavipes**, Meig. Zw. i. 82. 35 (1818); Stæg.; Winn.! Linn. Ent. vi. pl. 7. f. 54.—*hortulanus*, Meig.; Zett.; Rs. *Fœm.* niger, nitidus, capite postico, facie, palpis, antennisque nigro-fuscis, alis limpidis, venis apud costam pallide fuscis, halteribus albidis, capitulis nigris, pedibus fulvis nigro-variis. Long.  $1\frac{1}{2}$ — $1\frac{2}{3}$ ; alar. 3 lin.

*Fem.* Black, shining. *Hind head, face, palpi, and antennæ blackish-brown.* First joint of the antennæ cylindrical, contracted before and beyond the middle; the following seven joints more oval, contracted only in the middle; the five last cylindrical, much elongated, somewhat widened at the base of each. Wings limpid; veins pale brown towards the costa. *Halteres whitish, with black knobs.* *Fore legs tawny; femora with eight spines; knees, tips of the tibiæ, and tarsi, black; first tarsal joint tawny, with a black tip; second more or less tawny towards the base.* *Middle legs tawny; tarsi, apical third part of the femora, and tips of the tibiæ, black; first tarsal joint tawny, with a black tip.* *Hind legs black; femora tawny for two-thirds of the length from the base.* Ungues short.

Generally distributed. (E. S. I.)

56. **spinipes**, Meig. Zw. i. 81. 33 (1818); Winn.! Linn. Ent. vi. pl. 7. f. 55. *Mas.* niger, nitidus, capite nigro-fusco, alis limpidis, venis apud costam fuscis, halteribus albis, abdomine fusco apud apicem nigro, pedibus fulvis, genibus, tibiis apice tarsisque nigris, tarsorum articulis quarto et quinto fuscis, femoribus posticis apices versus nigris. Long. 1; alar. 2 lin.

*Male.* Head blackish-brown. Antennæ and their plumes rather paler; the long apical joints with white-glistening verticillate hairs. Thorax black, shining. Wings limpid; veins towards the costa brown. Halteres white. Abdomen brown, black towards the tip; forceps very small, with pointed blades. Legs tawny; knees, tarsi, and tips of the tibiæ, black; fourth and fifth tarsal joints brown; apical third part of the hind femora black; fore femora armed with seven spines; middle fe-

mora with one spine; hind femora with three spines; unguis short and slender.

Not rare. (E.)

57. **brachialis**, Hal. Ent. Mag. i. 152 (1833). *Mas*, "niger, nitidus, antennis puberulis flavidis, alis nudis fusco-hyalinis, halteribus apice nigris, abdomine basi flavido, pedibus luteis, femoribus apice nigris anticis subtus spinulosis. Long.  $1\frac{1}{3}$ ; alar.  $2\frac{1}{2}$  lin.

"*Male*. Shining black. Face piceous. Proboscis short and stout. Palpi nearly filiform, dusky yellowish. Antennæ dusky yellowish; the intermediate joints simply pubescent, but the short joints not so strongly separated as in the other species of this genus, forming a nearly linear flagellum. Thorax very large and convex. *Wings smoky hyaline*, naked, with pale brown veins; second cubital areolet nearly three times as long as the first. Halteres yellowish, with black tips. *Abdomen pitchy, more or less yellowish-pellucid at the base; beneath yellowish, with the tip pitchy*. Hypopygium small. *Legs tawny-yellow; posterior coxae rather dusky; femora black at the tip; tarsi dusky at the tip; hind tibiae darker, nearly black at the tip; hind tarsi rather darker; unguis small, equal (as usual in the male); fore femora stout, armed beneath with black spines (six to ten); hind tibiae sparingly and slightly ciliated*.

"Rare. Found at Holywood, generally at the skirts of young larch plantations. (I.)

"*Obs. C. armipes*, Meig. (Zw. vii. 20, 70), resembles this species in many respects, but the *halteres are white*."—Hal. MSS.

58. **distinctus**, Hal. Ent. Mag. i. 152 (1833). *Fœm.* "niger, nitidus, scutello flavo, pleuris pedibusque luteis, posticis obscurioribus, alis nudis hyalinis, halteribus albidis, femoribus apice nigris anticis subtus spinulosis. Long.  $1\frac{1}{2}$ ; alar. 3 lin.

"*Fem.* Face dusky yellow. Proboscis stout. Palpi nearly filiform, dusky. Antennæ dusky yellow; first joint large, pitchy black. Thorax above pitchy black. Scutellum yellow. Pleuræ tawny-yellow; a band descending under the wings, and the middle of the mesosternum dusky. Wings nearly hyaline; veins light brownish-yellow; second cubital areolet narrow, more than twice as long as the first; veining nearly as in *C. flavigipes*, but the first cubital areolet rather longer. Halteres creamy-white, yellowish at the base. Legs tawny-yellow; fore femora with the tip only, middle pair to one-fourth, hind pair to one-half, black; fore tibiae with a blackish dot at the tip; tarsi dusky at the tip (the last three joints); unguis small, equal, with a small tooth at the base (as in *C. ferrugineus*); fore femora stout, armed with black spines beneath (ten, or fewer)."—Hal. MSS.

Very rare. Found at Holywood. (I.)

59. **variegatus**, Winn. Linn. Ent. vi. 59. 57. pl. 7. f. 57 (1852). *Mas et Fœm.* niger, nitidus, facie, proboscide palpisque fusco-flavis, pectore fulvo aut nigro-fusco maculis duabus lateralibus argenteis, alis

sionally yellowish; second joint long. *Thorax pale grey, with two stripes and two spots of a coffee-brown colour*; the spots are behind the stripes, which are occasionally interrupted. Scutellum sometimes more or less tawny. *Metathorax and abdomen blackish-brown, the latter with whitish sutures*. Wings limpid; veins pale brown. Halteres tawny, with blackish-brown knobs. Legs tawny, more or less blackish-brown at the tips of the femora, of the tibiæ, and of the joints of the tarsi; these bands as usual are broader on the femora than on the tibiæ, and on the hind legs than on the fore legs; fore femora armed with seventeen spines; middle femora with four; hind femora with three; hind plantæ with a stout bristle on the side. *Mate.* Antennæ blackish-brown, their plumes with a yellowish glistening. *Fem.* Antennæ brown, generally with yellow bands, yellowish at the base; joints from the first to the eighth oval, almost cylindrical; from the ninth to the thirteenth elliptical, very long; first joint elongated before the middle; second and six following elongated beyond the middle. Wings slightly yellowish towards the costa.

Generally distributed. (E.)

64. **tibialis**, Meig. Z. i. 82. 36 (1818); Stæg.; Rs.; Zett.; Winn. ! Linn. Ent. vi. pl. 8. f. 62.—*apicalis?* Roser. *Fœm. niger, nitidus, facie, palpis antennisque nigro-fuscis, alis subfuscouscentibus apud costam obscurioribus, venis fuscis apud costam nigro-fuscis, abdomine basi subcontracto, pedibus fulvis, femoribus tibiisque apice fuscis, tarsis albo-flavis apice nigris, tibiis posticis nigris.* Long.  $1\frac{1}{2}$ ; alar. 3 lin.

*Fem. Black, shining.* Face, palpi, and antennæ blackish-brown; joints of the latter from the first to the eighth oval, almost cylindrical, somewhat straightened beyond the middle; from the ninth to the thirteenth elliptical, much elongated. Wings somewhat brownish, darker towards the costa; veins brown, blackish-brown in front. Halteres black; petioles occasionally yellowish-white. Legs tawny; tarsi whitish-yellow; fourth and fifth joints with black tips, wholly black in the hind tarsi; anterior knees and tips of the anterior tibiæ brown; hind femora for one-third of the length from the tips, and the whole of the hind tibiæ, black; fore femora and hind femora somewhat incrassated; fore femora with ten spines, middle femora with two, and hind femora with four; plantæ with five pair of spines; unguis stout.

Generally distributed. (E. S. I.)

65. **fasciatus**, Meig. Z. i. 79. 27 (1818); Mcq.; Stæg.; Blanch.; Zett.; Winn. ! Linn. Ent. vi. pl. 8. f. 63.—*cingulatus*, Meig.; Rs.—*marginatus*, Steph.; Curt. ! B. E. 285. *Fœm. pallide cinereus, palpis fulvis aut nigro-fuscis, antennis nigro-fuscis, articulis inferioribus basi saepissime fulvis, thorace vittis tribus fuscis, scutello saepe plus minusve fulvo, metathorace nigro-fusco, alis hyalinis, venis pallidis apud costam fuscis, halteribus albis, abdominis basi apiceque nigro-fuscis, pedibus fulvis plus minusve nigro-fusco variis.* Long.  $2\frac{1}{2}$ ; alar. 5 lin.

*Fem.* Front and face grey, blackish-grey, or brown. Palpi tawny

or blackish-brown, occasionally partly tawny, partly blackish-brown. Antennæ blackish-brown; joints from the first to the fifth or sixth generally tawny at the base; first joint large, cylindrical, almost oval, contracted before the middle; second and six following joints elongate-oval, somewhat straitened beyond the middle; ninth and four following elongated, elliptical. *Thorax bluish-ash grey, mouse-grey, or whitish-grey, with three coffee-brown stripes.* Scutellum grey, sometimes more or less tawny. Pectus grey or blackish-grey, glistening-hoary. Metathorax blackish-brown. Wings limpid, whitish in some aspects; veins pale, brown towards the costa. Halteres white. *Abdomen whitish-grey or yellowish-white*, first segment wholly, and the following at the base, blackish-brown; last segment blackish-brown, with a white hind border. Legs tawny; femora and tibiæ more or less blackish-brown towards the tips; joints of the tarsi with black tips; plantæ with five or six pair of spines; fore femora and hind femora somewhat incrassated; fore femora with twenty-one to thirty spines; middle femora with seven to twelve spines; hind femora with eight to sixteen spines.

Not common. (E.)

66. **femoratus**, F. S. A. 45. 35 (1805); Latr.; Meig.; Stæg.; Meq.; Rs.; Zett.; Winn. ! Linn. Ent. vi. pl. 8. f. 64.—*morio*, F.; Gmel.; Meig.; Meq.; Stæg.; Zett.—*ater*, Meig.; Rs.—*rufitarsis*, Meig.—*armatus*, Meig. *Mas et Fæm.* niger, nitens, alis limpidis aut fuscescentibus, venis albidis aut nigro-fuscis, halteribus albis, pedibus plus minusve fulvo variis, femoribus tibiisque posticis longiusculis, illis incrassatis et spinosis, tarsis albidis aut fulvis articulis apice obscurioribus; *Mas*, antennarum pluma apice albo-nitente. Long. 1-1½; alar. 2-2½ lin.

*Male and Fem.* Black, shining. Wings limpid-white, occasionally more or less brownish; veins whitish or brown. Halteres white. Legs often more or less tawny; tarsi whitish or tawny; the joints darker towards their tips; hind femora and hind tibiæ rather long, the former incrassated, thickly spinose beneath, slightly spinose above. *Mate.* Plumes of the antennæ glistening-white towards their tips. Claws slender, of equal length on all the tarsi. *Fem.* Claws of the anterior tarsi of equal length. Hind tarsi with one claw four times the length of the other.

Winnertz describes twelve varieties of this species. Generally distributed. (E. S. I.)

67. **inflatus**, Winn. ! Linn. Ent. vi. 71. 65. pl. 8. f. 65 (1852). *Mas, ater, nitidus*, fronte nigro-obscurō, facie palpisque nigro-fuscis, antennarum plumis apice albidis, alis albidis, venis pallidis apud costam fuscescentibus, halteribus albis, *abdominis segmentis primo, secundo tertioque apiceque albis*, pedibus albis, femoribus, tibiis tarsisque apice nigris. Long.  $\frac{5}{6}$ ; alar.  $1\frac{2}{3}$  lin.

*Male.* Front dull black. Face and palpi blackish-brown. Antennæ and their plumes blackish-brown, the latter with glistening-white tips.

spinc. *Male*. Antennæ black, their plumes brown, gilded. *Fem.* Joints of the antennæ from the first to the eighth oval, with white bands; from the ninth to the thirteenth brown, elliptical.

Rare. (E.)

74. **gracilis**, Winn. Linn. Ent. vi. 76. 72 (1852). *Mas et Fœm. niger, nitidus*, palpis albidis, alis albidis, venis pallidis apud costam subfusciscentibus, halteribus nigro-fuscis, petiolis basi albidis, pedibus anterioribus albis nigro-fusco-fasciatis, femoribus tibiisque posticis nigro-fuscis; *Mas*, antennis nigris plumis aurato-fuscis; *Fœm.* antennis albo-fasciatis apices versus totis fuscis. Long. 1-1 $\frac{1}{4}$ ; alar. 2-2 $\frac{1}{2}$  lin.

*Male and Fem. Black, shining.* Palpi whitish. Wings whitish; veins pale, brownish towards the costa. Halteres blackish-brown, whitish at the base. Anterior legs white; apical band of the femora, knees, middle band and tips of the tibiæ, and tips of the joints of the tarsi, blackish-brown; fore femora with a subapical spine. Hind legs blackish-brown, shining; femora and tibiae yellowish at the base; tarsi white, their joints with black tips. *Male*. Antennæ black, their plumes brown, gilded. *Fem.* Joints of the antennæ from the first to the eighth oval, with white bands; from the ninth to the thirteenth brown, elliptical.

(E.?)

75. **ornatus**, Meig. Zw. vi. 262. 47 (1830); Winn. *Mas et Fœm. ater, capite postico albidente, palpis fusco-flavis, thorace subnitido cinerascente vittis tribus maculisque duabus lateralibus argenteis, alis albidis, venis pallidis apud costam subfusciscentibus, halteribus albis apice nigris, abdome nigro-fusco aut nigro vix nitido, pedibus flavis fasciis nigro-fuscis, tarsis albis articulis apice nigro-fuscis; Mas, antennis fuscis, plumis aurato-fuscis; Fœm. antennis fuscis flavo-cinctis.* Long. 1; alar. 2 lin.

*Male and Fem.* Hind part of the head glistening-whitish; two black marks behind the vertex. Palpi brownish-yellow. *Thorax deep black, slightly shining, with a dark greyish glistening, adorned with three stripes, and on each side with two spots of a silvery hue.* Wings whitish; veins pale, brownish towards the costa. Halteres white; the knobs, or the tips of the knobs, black. Abdomen blackish-brown or black, hardly shining, except at the tip. Legs yellow; femora and tibiæ with black bands, which are very broad on the hind legs; tarsi white, their joints with blackish-brown tips; fore femora with a spine beneath towards the tips. *Male*. Antennæ brown, their plumes gilded-brown. *Fem.* Joints of the antennæ from the first to the eighth oval, yellow towards the base, brown towards the tips; from the ninth to the thirteenth elliptical, brown.

Not common. (E.)

76. **albipes**, Winn. ! Linn. Ent. vi. 77. 74. pl. 8. f. 72 (1852). *Mas, ater, nitidus, antennarum plumis apice albidis, alis albis, venis pallidis apud costam pallide fusciscentibus, halteribus nigris, tarsorum*

*articulis primo secundo tertioque albis apice nigris.* Long.  $\frac{5}{6}$ ; alar.  $1\frac{2}{3}$  lin.

*Male.* Deep black, shining. Antennæ and their plumes black, the latter glistening-white at the tips. Wings white; veins pale, pale brown towards the costa. Halteres black. *First, second, and third joints of the tarsi white, with black tips.* Fore femora with three spines beneath towards the tips.

(E.?)

77. **solstitialis**, Winn. ! Linn. Ent. vi. 78. 75. pl. 8. f. 73 (1852). —*circundatus*? Stæg.; Zett. *Mas et Fœm. cinereus*, palpis antemisque fuscis, thorace vittis quatuor fuscis, alis hyalinis subfuscis, venis pallide fuscis apud costam obseurioribus, halteribus fuscis, petiolis sordide albis, tarsis albis articulis apice fuscis; *Mas, abdomine fusco*, pedibus flavescentibus fusco-cinctis; *Fœm. abdomine nigro-fusco incisuris albidis*, pedibus albo-flavis fusco-cinctis. Long.  $1-1\frac{1}{4}$ ; alar.  $2-2\frac{1}{2}$  lin.

*Male and Fem.* Palpi and antennæ brown. *Thorax grey, with four brown stripes.* Wings hyaline, brownish; veins pale brown, darker towards the costa. Halteres dingy white, with brown knobs. Fore femora with four spines beneath towards the tips; tarsi white, their joints with brown tips. *Male.* Head black; vertex with a glistening-white dot. Plumes of the antennæ very thick, brown, tinged with glistening-yellow. *Abdomen brown.* Legs yellowish; tips of the femora and of the tibiæ brown; femora with a brown band near the tips; tibiæ with a brown band before the middle. *Fem.* Head brown, with white hairs above. Joints of the antennæ from the first to the eighth oval, their clubs often yellow; from the ninth to the thirteenth elongated, elliptical. Thorax with a glistening-hoary tinge. Wings darker than those of the male. *Abdomen blackish-brown, with whitish sutures*, somewhat straitened at the base and at the tip. Legs whitish-yellow; femora and tibiæ with black tips, the former with a brown band near the tips, the latter with a brown band near the base. Var. *Male.* Hind femora and hind tibiæ brown for one-third of the length from the tips. Var. *Fem.* Hind femora blackish-brown for one-third of the length from the tips. Hind tibiæ blackish-brown for half the length from the base.

(E.?)

78. **nobilis**, Winn. ! Linn. Ent. vi. 79. 76. pl. 8. f. 74 (1852). *Fœm. fulvis*, palpis flavis, antennis apiees versus fuscis, thoracis disco argenteo-einereo vittis duabus fuscis, alis, venis halteribusque albis, pedibus albo-flavis nigro-cinctis, posticis nigris albo-flavo-cinctis. Long.  $1\frac{1}{2}$ ; alar. 3 lin.

*Fœm. Tawny.* Palpi yellow. Joints of the antennæ oval, with brownish-yellow clubs; from the ninth to the thirteenth long, elliptical, brown; first joint longer by half than the second, contracted before the middle. Disc of the thorax grey, with a silvery tinge on a tawny ground, and with two coffee-brown stripes. Wings, veins, and halteres white. Legs whitish-yellow; fore femora blackish-brown at the tips, near which there

"*C. valvatus*, Winn. Glossy. Wings with dark veins; cubital areolet more elongated.

"*C. gracilipes*, Winn. Cubital areolet shorter at the costa.

"*C. albipes*, Winn. Glossy. Cubital and radial veins *near* at the end.

"*C. pratensis*, Meig. Zw. vi. 264; and *C. flavitarsis*, Stæg.; Zett. D. Sc. 3663. Glossy black."—*Hal. MSS.*

82. ***pictus***, Meig. Zw. i. 80. 29 (1818).—*elegans*, Winn. ! Linn. Ent. vi. 58. 56. pl. 7. f. 56. *Fœm. schistaceo-cinereus, facie nigro-cinerea, thorace vittis tribus fuscis, alis lacteis, halteribus albis apice fuscescentibus, abdomine flavidio-albo basi fasciisque nigro-fuscis, pedibus nigro-fuscis, tibiis anticus albo-fasciatis, tarsis albis articulis apice nigris.* Long. 2; alar.  $3\frac{3}{4}$  lin.

*Male.* "Broader than any other species of the genus. Face, palpi, and antennæ fuscous. Face shining. Occiput opaque fuscous, with grey bloom. Antennæ clothed only with fine pubescence (not feathered), scarcely longer than the breadth of the head; first joint globose, blackish, with a white apical edge; second obconical, longer than the third, yellowish at the base; following joints oblong; the next a little more slender, ovate; the last three ovate, twice as long and broad as those which precede. Pronotum dull ferruginous, with white gloss. Thorax dark brown, opaque, with hoary bloom. Mesonotum with three broad rust-brown bands, confluent on the back, leaving a patch at each anterior angle, and a line in front (dividing the middle band) of the lighter grey ground-colour. Wings naked, whitish-hyaline; anterior veins pale yellowish, the rest colourless; two cubital areolets, second about twice as long as the first; second branch of præbrachial vein arising before the transverse veinlet. Halteres creamy; base tawny. Abdomen glossy, pitchly; anterior segments somewhat diaphanous, with the base darker and forming a situated transverse band; hind edge of posterior segments creamy-white. Hypopygium blackish, much narrower than the abdomen; the joints of nearly equal length; first joint much thicker, conical; second slightly curved, linear, not acute, between them a bilobed process exceeding the tip of the ventral plate. Legs piceous; femora with some minute spines towards the tips beneath; fore pair thickest; hind tibiae very faintly ciliated; basal joints of the tarsi yellowish, with dusky tips; terminal joints almost entirely dusky; last joint not so long as the two preceding together, armed towards the tip beneath with two spines. Onychia obsolete."—*Hal. MSS.*

Rare. Two specimens of the male found by Mr. Haliday in July near Bexley, in Kent? (E.)

"In my descriptions of *Ceratopogon*, the first externo-median vein mentioned is not the subapical; but the first, not particularly named, which lies next behind it, and in *Ceratopogon* usually springs from the subapical a little beyond the end of the præbrachial areolet, so as to form the first (petiolated) *fork* of the two

which run out on the hind margin; the second being formed by the subanial springing from the pobrazial vein. At other times the first externo-median arises exactly at the end of the præbrazial areolet ("interstitial"), or else (as in most with one entire cubital areolet) from the præbrazial vein, a little before the end of the areolet. I have treated the two strong veins behind the costal as radial and cubital, and the faint vein before them as subcostal (supposing the mediastinal to be obliterated). But if the faint trace of a forked vein towards the apex of the wing figured by Winnertz in a few, is not (as I suppose) a spurious vein, it would be the cubital, and my cubital would = the true radial, and my radial would = the subcostal, and my subcostal would = the mediastinal."—*Hal. MSS.*

---

Genus V    **CLUNIO.**

**CLUNIO**, Haliday, Nat. Hist. Review, ii. Proc. 62 (1855).

"*Mas.* Proboseis obsoleta. Antennæ 11-articulatæ, artieulis tertio et ultimo elongatis. Alæ alutaceæ, venis duabus fureatis, transversis nullis.

"*Male.* Proboseis obsolete. Antennæ eleven-jointed; third and eleventh joints elongated. Wings adiaphanous, with two forked veins; no transverse veins.

" 1. **marinus**, Hal. Nat. Hist. Rev. ii. Proc. 62. pl. 2. f. 4 (1855). *Mas*, obseure ferrugincus, antennis, alis, halteribus pedibusque sordide albis, thoracis lateribus antieis scutelloque flavescentibus. Long.  $\frac{4}{5}$ ; alar.  $1\frac{4}{5}$  lin.

"*Male.* Dusky ferruginous. Head rounded, inflected to the præsternum. Mouth obsolete. Eyes rounded; distant above, approximate beneath, the antennæ. Antennæ, wings, halteres, and legs dingy white. Antennæ eleven-jointed, shorter than the thorax; the short joints rather dusky; the basal joints subglobose; the terminal ovate; the third and last elongate, this elliptical. Thorax projecting over the head; scutellum and sides of the thorax before the wings pale yellowish; mesonotum divided by two parallel sutures, with an elevated line down the middle, and a depression before the convex semicircular scutellum; metathorax very short; mesosternum gibbous. Wings adiaphanous, naked, except the pubescent margin; præbrazial vein bifurcated about the middle, embracing the apex with its branches; pobrazial forked near the margin, with the hinder branch (or the subanial vein) recurved, ending at the posterior margin; radial-cubital vein fainter between the præbrazial and the costa, ending at about the middle of the latter; anal vein simple. Abdomen dusky, with naereous gloss, shorter than the thorax, dilated backwards; the segments linear-transverse. Hypo-

pygium as long as the abdomen, and thicker; lateral arms massive, oblong, with a smaller mallocliform piece articulated to the end; below them an oblong plate, rounded at the tip. Legs of moderate length; fore pair distorted at the base; coxae ferruginous; extreme base of the tibiæ blackish; tarsi shorter than the tibiæ; anterior pairs with the first joint long, the following three very short; hind pair with the third joint also elongated.

"Inhabits the sea-coast, among the moist gravel bared by the ebbing tide; walks about with the wings raised, and half expanded, in constant vibration, but without taking flight, as far as observed."—*Haliday*. July. Holywood (Down); Valentia Ferry (Kerry). (I.)

---

### FAMILY VII. CULICIDÆ.

CULICIDÆ, Steph. Syst. Cat. ii. 232 (1829); Curt.; Westw.; Hal. *Tipulariæ culiciformes* p., Meig. *Culicides*, Latr.; Mcq.; Zett. *Culicina* p., Newm. *Culicina*, Agass. *Culicinæ*, Rond.

Ocelli nulli. Mesothoracis scutum integrum. Alæ oblongæ, incumbentes, apice rotundatae; margo posticus squamis fimbriatus; vena costalis circum marginem posticum attenuata; venæ apicales plus quam sex.

Ocelli none. Scutum of the mesonotum undivided. Wings and halteres developed. Wings oblong, rounded at the tip, incumbent; hind margin fringed with scales; costal vein attenuated round the hind margin; veins in their last subdivisions more than six.

This family contains the five following genera:—

- a. Proboscis long, with mandibles and maxillæ.
- b. Palpi short in the female.
  - c. Palpi short in the male. 1. AËDES.
  - c c. Palpi long in the male. 2. CULEX.
  - b b. Palpi long in the male and the female. 3. ANOPHELES.
- a a. Proboscis short, without mandibles or maxillæ.
  - b. Metatarsus longer than the second joint. 4. CORETHRA.
  - b b. Metatarsus shorter than the second joint. 5. MOCHLONYX.

#### Genus 1. AËDES.

AËDES, Hoffm.; Meig. Zw. i. 13 (1818); Mcq.; Staeg.; Zett.

Corpus elongatum, parvum, pubescens. Caput parvum. Oculi transversim lunati, supra autenuas conjuncti. Proboscis porrecta, antennarum longitudine. *Palpi brevissimi*. Antennæ 14-articulatae, porrectæ, filiformes, thoracis longitudine. Thorax subconvexus,

antice paullo depresso. Alæ angustæ, elongatæ, incumbentes, ab dominis longitudine, apud venas squamosæ. Abdomen pilosulum, thorace duplo longius. Pedes graciles, sat longi, subnudi, inermes; tibiæ tenuiter spinulosæ, unguis parvi. *Mas.* Antennæ plumosæ. Forceps analis modice longa. *Fœm.* Antennæ breviter pilosæ. Forceps analis brevis.

Body elongate, small, pubescent. Head small. Eyes transversely lunate, connected above the antennæ. Proboscis porrect, as long as the antennæ. *Palpi very short.* Antennæ fourteen-jointed, porrect, filiform, as long as the thorax. Thorax slightly convex, rather depressed in front. Wings elongated, narrow, incumbent, as long as the abdomen; veins fringed with scales, similar in structure to those of *Culex*. Halteres small. Abdomen slender, slightly pilose, twice the length of the thorax. Legs slender, unarmed, rather long, nearly bare; tibiæ minutely spinulose; unguis small. *Male.* Antennæ plumose. Anal forceps moderately long. *Fœm.* Antennæ pilose; hairs short. Anal forceps short.

The only known species of this genus frequents marshy spots, and the larva is probably aquatic.

1. **cinereus**, Hoffm.; Meig. Zw. i. 13. 1 (1818); Mcq.; Stæg.; Zett.; Lehm. Cinereus, thorace rufo-hirto, alis immaculatis, femoribus pallidioribus. Long. 2-2½; alar. 4 lin.

Rare. Found by the Rev. Leonard Jenyns, in Cambridgeshire, and by Mr. Haliday in the county of Cork. (E. I.)

---

## Gensis II. **CULEX.**

**CULEX**, Meig. Zw. i. 1 (1818); Steph.; Curt.; Mcq.; Westw.; Zett.; Stæg. *Culex* p., L.; F.; D. G.; Schr.

Corpus elongatum, mediocre, pubescens. Caput parvum. Oculi transversim lunati, supra antennas conjuncti. Proboscis porrecta, antennæ paullo longior. Palpi porrecti, 5-articulati. Antennæ 14-articulatæ, porrectæ, filiformes, thoracis longitudine. Thorax elongatus, subconvexus. Scutellum parvum. Alæ angustæ, elongatæ, lanceolatæ, incumbentes, apud venas squamosæ, abdominis longitudine. Abdomen angustum, segmentis octo, thorace duplo longius. Pedes longi, graciles, subnudi, inermes; coxae breves; tibiæ tenuiter spinulosæ; tarsi postici præsertim longissimi; unguis parvi. *Mas.* *Palpi proboscide paullo longiores.* Antennæ verticillato-plumosæ. *Fœm.* *Palpi brevissimi.* Antennæ breviter verticillato-pilosæ.

Body elongated, pubescent, brown, grey, or testaceous, of moderate size. Head small. Eyes transversely lunate, connected above the antennæ. Proboscis porrect, a little longer than the antennæ. Palpi five-jointed, porrect. Antennæ fourteen-jointed, porrect, filiform, as long as the thorax. Thorax elongated, slightly convex. Scutellum

small. Wings narrow, elongated, lanceolate, incumbent, as long as the abdomen; veins fringed with scales; mediastinal vein ending beyond two-thirds of the length of the wing; subcostal ending at a little in front of the tip; radial emerging from the subcostal at before half the length of the wing, forked beyond half its length, its hind fork ending at the tip of the wing; cubital proceeding from the præbrachial transverse veinlet; subapical forked towards its tip; præbrachial, subanal, and anal complete; subaxillary not reaching the border. Areolets fourteen,—the subcostal, the mediastinal, two radial, the cubital, two subapical, the præbrachial, the pectoral, two externo-medial, the anal, the axillary, and the subaxillary. Posterior margin much excavated, and forming an acute angle at the base. Halteres rather small. Abdomen with eight segments, rather narrow, about twice the length of the thorax. Legs long, slender, unarmed, nearly bare; coxae short; tibiæ minutely spinulose; tarsi very long, especially the hind pair; unguis small. *Male.* *Palpi a little longer than the proboscis.* Antennæ verticillate-plumose. *Fem.* *Palpi very short.* Antennæ verticillate-pilose; hairs short. Eggs elongated, oval, with a small and narrow knot at the top, deposited side by side in small masses. Larva aquatic. Head distinct, rounded, with two inarticulate antennæ and some ciliated appendages. Thorax furnished with bundles of hairs. Abdomen long, nearly cylindrical, much narrower than the thorax, with ten segments; on the eighth a long respiratory organ, which is radiated at the tip; the tenth terminated by setæ, and by five slender conical plates. Pupa active, much curved, swimming by means of the tail and of two terminal natatorial organs; its organs of respiration consisting of two tubular horns on the thorax. Abdomen terminated by two slender oval plates.

“ The pupa usually remains suspended with the posterior end of the body turned downwards; but when the period for its change is arrived, it stretches it out upon the surface above which its thorax is elevated. Seareely has it been a moment in this position than, swelling out the interior and anterior parts of the thorax, it causes it to split between the two respiratory horns. Through this opening the anterior part of the gnat then emerges. As soon as the head and trunk are disengaged, it proceeds with its labour, and gets out more and more, elevating itself by means of its abdominal segments. Numbers now perish, their boats being upset by the wind; but the gnat that escapes, having fixed itself thus perpendicularly, draws first its two anterior legs out of their ease and moves them forward, and next the middle pair; then inclining itself towards the water, it rests its legs upon it. As soon as it is thus upon the water, it is in safety; its wings unfold themselves and are dried, and it flies away. The lancets are finer than a hair, very sharp, and barbed occasionally on one side. It is furnished

near the end of its body with an organ which varies in length according to the species, and forms an angle with the last segment but one. The mouth of this organ is tunnel-shaped, and terminates in five points, like a star; and by this it is usually suspended at the surface of the water, and preserves its communication with the atmosphere. In its interior is a tube which is connected with the trachea, and terminates in several openings at the mouth of the organ. The points of the mouth, when the animal is disposed to sink in the water, are used to close it, and cut off its communication with the atmosphere. When the animal is immersed, a globule of air remains attached to the end of the tube, so that it is in fact of less specific gravity than that element, and it is not without some effort that it descends to the bottom; but when it wishes to rise again, it has only to unclose the tube, and it rises without an effort to the surface, and remains suspended for any length of time. Its anal extremity is clothed with bunches of hairs, which are furnished with some repellent material which prevents their becoming wet, and probably causes the dimple or depression of the water round the mouth of the tube. When the larva becomes a pupa, instead of a single respiratory appendage, it is furnished with a pair, each in shape resembling a cornucopia, and proceeding from the upper side of the thorax. By these tubular horns it respires and is suspended at the surface.”

This genus, the Gnat or Mosquito, is too well known, from the blood-sucking propensity of the female, to require any particular notice. It is plentiful in all countries, whether arctic or tropical, which abound in wood and water. The female lays about three hundred eggs; nearly a month intervenes between the egg-state and the fly-state, and there are several successive generations in one year.

“ Immense swarms of some species have occasionally appeared in England, and at a distance have been mistaken for columns of smoke. Gnats emit no sound when flying early in the spring, before their thirst for blood is awakened. The warmer the weather, the greater is their thirst for blood, the more forcible their flight, the motion of their wings more rapid, and the sound produced by that motion more intense.”

*a.* Tarsi with pale bands.

*b.* Veins of the wings with five tufts of scales. Species 1.

*b b.* Veins of the wings not tufted. Species 2-4.

*a a.* Tarsi without bands.

*b.* Knees with white spots. Species 5.

*b b.* Knees without spots. Species 6-9.

1. **annulatus**, F. Mant. Ins. ii. 363. 2 (1787); Gmel.; Vill.; Lam.; Latr.; Meig.; Steph.; Mcq.; Zett.; Gim.; Stæg.—*affinis*, Steph. *Fuscus, thorace vittis duabus nigrieantibus, alis subcinereis nigro quinquefasciulatis, abdomine fasciis albidis, pedibus testaceis, tarsis fasciis albidis.* Long.  $3\frac{1}{2}$ –4; alar.  $6-6\frac{1}{2}$  lin.

Brown. Proboscis testaceous, brown towards the tip. Thorax with two blackish stripes. Wings slightly greyish; veins and borders fringed with black scales, which form five tufts on the forks of the veins. Abdomen with a whitish band on the fore border of each segment. Legs dull testaceous; femora and tibiae irregularly marked with black, their tips black; tarsi black, with five whitish bands. *Male.* Palpi blackish, testaceous from a little beyond the middle to the tips, with a whitish band a little before the middle. Antennæ whitish, with black bands and tips. *Fem.* Antennæ black.

Generally distributed. Frequent houses. (E. S. I.)

2. **cantans**, Hoffm.; Meig. Zw. i. 6. 6 (1818); Steph.; Meq.; Zett.; Gim.; Stæg.—*maculatus*, Meig.; Steph. *Ferrugineus, thorace vittis duabus fuscis, alis sublimpidis, abdomine nigro-fuseo fasciis albidis, pedibus testaceis, tarsis nigris albo-fasciatis.* Long.  $3\frac{1}{2}$ –4; alar.  $6-6\frac{1}{2}$  lin.

*Ferruginous. Thorax with two brown stripes.* Peetus with whitish tomentum. *Wings nearly limpid;* veins and borders fringed with brown scales. *Abdomen blackish-brown;* a whitish band on the fore border of each segment. Legs testaceous, pubescent; tarsi black, with a white band at the base of each joint; metatarsus mostly testaceous. *Male.* Palpi testaceous, with two whitish bands, black, and with black hairs towards the tips. Antennæ whitish, with black bands and tips. Abdomen whitish along each side. *Fem.* Antennæ brown, testaceous towards the base.

Not common. (E.)

3. **annulipes?** Meig. Zw. vi. 241. 15 (1830); Gim.; Stæg.; Zett. *Mas, nigro-fuscus, alis sublimpidis, abdomine fasciis albidis, pedibus testaceis, tarsis fuscis albo-fasciatis.* Long.  $2\frac{1}{2}$ ; alar. 4 lin.

*Male. Blackish-brown.* Palpi blackish, with two white bands. Antennæ whitish, with black bands and tips. Thorax with pale down. Peetus with whitish tomentum. *Wings nearly limpid;* veins and borders fringed with brown scales. *Abdomen blackish-brown;* a whitish band on the fore border of each segment, dilated angularly on each side. Legs testaceous; tarsi brown, with a white band at the base of each joint.

Rare. In the British Museum. (E.) *This species much resembles C. cantans, but is smaller, the legs are more slender, and the tarsi proportionately much longer.*

4. **fumipennis**, Steph. Zool. Journ. i. 453. 5 (1825). *Fæm. rufotestaceus, thoracis dorso fusco subvittato, alis subcinereis, abdomine fusco,*

*fasciis ventreque testaceis*, pedibus testaceis, tarsis nigricantibus fasciis albidis. Long. 4; alar.  $6\frac{1}{2}$  lin.

*Fem.* Reddish-testaceous. Thorax above brown, indistinctly striped. Antennæ brown, with a whitish band at the tip of each joint. Wings slightly greyish; veins brown, fringed with brown hairs. Abdomen brown, testaceous beneath and on the fore border of each segment. Legs testaceous; femora and tibiæ with blackish tips; tarsi blackish, with a whitish band at the base of each joint.

Rare. In the British Museum. (E.) This species much resembles *C. cantans*, but may be easily distinguished by the much greater length of the fork of the subapical vein.

5. **nemorosus**, Meig. Z. i. 4. 3 (1818); Steph.; Mcq.; Zett.; Gim.; Stæg.—*reptans*, Meig. Klass.—*fasciatus*, Meig. Klass.—*guttatus*? Meg.; Meig.; Curt. ! B. E. 537.—*ornatus*? Hoffm.; Meig.; Mcq.; Stæg.; Zett. — *lateralis*? Meg.; Meig.; Gim. — *sylvaticus*, Meig.; Steph. Nigricans, thorace fasciis duabus albidis, alis cinereis, abdomine fasciis aut maculis lateralibus albis, pedibus nigris, femoribus testaceis apice nigris, genubus albo-punctatis. Long. 3– $3\frac{1}{2}$ ; alar. 5–6 lin.

Blackish. Thorax with two whitish stripes. Wings grey; veins black, fringed with black hairs. Legs black; femora pale testaceous, black towards the tips; a snow-white spot on each knee. *Male.* Palpi testaceous towards the base. *Fem.* Colours more marked, legs stouter than those of the male. Lancets testaceous. Abdomen with white bands, which are generally more or less interrupted in the middle, and form triangular spots on each side.

Inhabits woods, and does not infest houses like *C. annulatus* and *C. ciliaris*. (E.)

6. **detritus**, Hal. Ent. Mag. i. 151 (1833). *Nigro-fuscus, alis nigro-squamosis, abdomine pallido-annulato, ventre luteo trifariam fusco-punctato*, femoribus basi luteis. Long.  $2\frac{1}{2}$ –3; alar.  $4\frac{1}{2}$ –5 lin.

Blackish-brown. Disc of the thorax nearly bare. Wings thickly clothed with dusky black scales. Abdomen with pale bands; under side pale, with three rows of brown punctures. Femora luteous at the base.

"In multitudes during the day among hedges on the sea-coast; in the evening, in columns about the tops of trees, appearing like smoke at the distance of a furlong. It is attached particularly to water-cuts in the neighbourhood of the sea. The reddish gnat (*C. ciliaris*, L.) is more general, and enters more into houses, but I have not observed it in such clouds as *C. detritus*."—Hal. MSS.

7. **ciliaris**, L. S. N. 2. 1002. 2 (1767); Schr.; Gmel.; Zett.—*pipicus*, Geoff.; Vill.; Schr.; Meig.; Steph.; Mcq.—*rufus*? Hoffm.; Meig.; Steph.—*domesticus*? Germ.; Meig.; Steph. *Ferrugineus, thorace vittis duabus canis, alis subcinereis, abdomine fasciis testaceis, pedibus testaceis, tarsis fuscis*. Long.  $2\frac{1}{2}$ –3; alar.  $4\frac{1}{2}$ –5 lin.

*Ferruginous.* Proboscis testaceous, black towards the tip. *Thorax with two hoary stripes.* Wings very slightly greyish; veins brown, fringed with brown hairs. Abdomen with a testaceous band on the fore border of each segment. Legs testaceous; tarsi brown. *Male.* Palpi testaceous, black towards the tips. Antennæ testaceous, with black rings. *Fem.* Palpi and antennæ black. Abdominal bands narrower and more clearly marked than those of the male.

The House Gnat. Generally distributed. (E. S. I.)

8. **bicolor**, Meg.; Meig. Zw. i. 9. 13 (1818); Steph.; Gim.—*flavirostris*, Steph.—*punctatus*, Mcig. ?; Gim. ?; Steph.—*marginalis*, Steph. *Fæm.* *Ferrugineus, thoracis dorso fuso, alis sublimpidis, abdomine testaceo suturis nigricantibus, pedibus testaceis, tibiis tarsisque fuscis.* Long. 3; alar.  $5\frac{1}{2}$ –6 lin.

*Fem. Ferruginous.* Antennæ blackish. *Thorax brown above,* with pale down. *Wings nearly limpid;* veins brown, and fringed with brown hairs. *Abdomen testaceous;* sutures of the segments blackish. Legs testaceous; tibiæ and tarsi brown; posterior tibiæ testaceous about the middle.

Not rare. (E.)

9. **lutescens**, F. Sp. Ins. ii. 470 (1781); Vill.; Gmel.; Meig.; Steph.; Gim. *Testaceus, thoracis dorso ferrugineo vittis duabus obscurioribus, alis limpidis.* Long. 3; alar.  $5\frac{1}{2}$ –6 lin.

*Testaceous.* Proboscis black towards the tip. *Thorax above ferruginous, with two darker stripes.* Wings limpid, with a pale yellowish tinge in front; veins pale. *Male.* Palpi black towards the tips. Antennæ with black rings. *Fem.* Palpi and antennæ black.

Not rare. (E.) This and *C. bicolor* may be varieties of one species, or both may be varieties of *C. ciliaris.*

### Genus III. ANOPHELES.

ANOPHELES, Meig. Zw. i. 10 (1818); Steph.; Curt.; Mcq.; Hal.; Zett.; Westw.; Stæg.; Loew. *Culex* p., L.; F.; Schr.; Gmel.; Mcig. Kl.

Corpus elongatum, mediocre, pubescens. Caput parvum. Oculi transversim lunati, supra antennas conjuncti. Proboscis porrecta, antennis paullo longior. *Palpi porrecti, proboscidis longitudine.* Antennæ 14-articulatae, porrectæ, filiformes, thorace vix breviores. Thorax elongatus, subconvexus, ante scutellum impressus. Scutellum parvum. Alæ angustæ, elongatæ, lanceolatae, incumbentes, apud venas squamosæ, abdominis longitudine. Abdomen angustum, segmentis octo, thorace duplo longius. Pedes longissimi, gracillimi, subnudi, inermes; coxae breves; tibiæ tenuiter spinulosæ; tarsi postici præsertim longissimi; unguis parvi. *Mas.* Palpi 5-articulati; articuli quartus et

quintus dilatati, ad latera reflexi. Antennæ plumosæ. *Fœm.* Palpi 4-articulati, simplices, reeti, subnudi. Antennæ breviter pilosæ. Body elongated, pubescent, grey or testaceous, of moderate size. Head small. Eyes transversely lunate, connected above the antennæ. Proboscis porrect, a little longer than the antennæ. *Palpi porrect, as long as the proboscis.* Antennæ fourteen-jointed, porrect, filiform, almost as long as the thorax. Thorax elongated, slightly convex, impressed in front of the scutellum, which is small. Wings narrow, elongated, lanceolate, inelegant, as long as the abdomen; veins fringed with scales, in structure like those of *Culex*. Halteres small. Abdomen with eight segments, narrow, about twice the length of the thorax. Legs very long and slender, unarmed, nearly bare; coxae short; tibiae minutely spinulose; tarsi very long, especially the hind pair; ungues small. *Male.* Palpi five-jointed; fourth and fifth joints dilated, laterally reflexed. Antennæ plumose. *Fœm.* Palpi four-jointed, simple, straight, nearly bare. Antennæ pilose; hairs short. Larva differing from that of *Culex* in having two oval tubercles behind the head, and two smaller tubercles near the tail, beneath which there are many long setæ.

This genus much resembles *Culex* in appearance, but the species are comparatively scarce, and the females are not blood-suckers.

1. **bifurcatus**, L. F. S. ii. 1002 (1767); F.; Sehr.; Gmel.; Meig.; Steph.; Hal.; Curt.; Meq.; Zett.; Gim.; Stæg.; Loew.—*trifurcatus*, F.—*claviger*, Meig. Kl.; F.—*plumbeus*, Steph.; Hal. Fuseus, thorace vittis quatuor albidis, alis sublimpidis, venis fuscis fuscoque ciliatis, abdomine pallide fusco fasciis obscurioribus, pedibus testaceis, genubus albidis. Long.  $3\frac{1}{2}$ ; alar. 6–7 lin.

Brown. Proboscis black at the tip. Palpi testaceous. Thorax with four whitish stripes. Wings nearly limpid; *veins brown, fringed with brown hairs.* Abdomen pale brown; hind borders of the segments darker. Legs dull testaceous; knees whitish. *Male.* Antennæ testaceous, with brown rings.

Not rare. (E. I.)

2. **maculipennis**, Meig. Zw. i. 11. 2 (1818); Steph.; Hal.; Curt.; Meq.; Zett.; Gim.; Stæg.; Loew.—*bifurcatus*, Meig. Kl.—*grisescens?*, Steph. Fuseus, thorace vittis quatuor testaceis, alis sublimpidis, venis fuscis ciliis fasciculisque nigricantibus, pedibus fuscis, femoribus testaceis, genubus tibiisque apie albidos. Long.  $3\frac{1}{2}$ ; alar. 7 lin.

Brown. Proboscis testaceous. Thorax with four testaceous stripes. Wings nearly limpid; *veins brown, fringed with blackish hairs, which are thickest and longest about the middle, near the costa, and towards the tips.* Legs brown; femora testaceous; knees and tips of the tibiae whitish. *Male.* Antennæ testaceous, with black bands.

Not rare. (E. I.)

---

## Genus IV CORETHRA.

CORETHRA, Meig. Illig. Mag. (1803); Latr.; Panz.; Meig.; Steph.; Meq.; Zett.; Gim.; Stæg.; Westw. *Tipula* p., L.; F. E. S.; D. G.; Gmel.; Meig. Kl. *Chironomus* p., F. S. A. *Tanypus* p., Lam.

Corpus mediocre aut parvum, elongatum, pubescens. Caput parvum, sessile. Oculi transversim lunati, subremoti. Os parvum, subelongatum. Proboscis antennis multo brevior. Palpi 4-articulati, cylindrii, pubescentes, incurvi, articulus primus brevis. Antennæ 14-articulatæ, porrectæ, filiformes, thoracis longitudine. Thorax longiovatus. Scutellum mediocre. Alæ angustæ, pubescentes, ineumentes, squamis ciliatæ, abdomine paullo breviores. Abdomen segmentis 8, gracile, elongatum, pilosum. Pedes graciles, pubescentes, inermes, sat longi. *Mas.* Antennæ verticillato-plumosæ. Abdomen apice valvulis duabus foliaceis subineurvis sat longis instructum. *Fem.* Antennæ verticillato-pilosæ. Abdomen apice hamulis duobus brevibus instructum.

Body of moderate size, elongate, pubescent. Eyes transversely lunate, separate in both sexes. Mouth small, slightly elongate. Proboscis much shorter than the antennæ, with two apical clavate appendages. Palpi four-jointed, cylindrical, pubescent, shorter than the antennæ; first joint shorter than the others. Antennæ fourteen-jointed, porrect, filiform, as long as the thorax. Thorax elongate-oval. Scutellum of moderate size. Wings narrow, pubescent, a little shorter than the abdomen, incubent during repose; veins fringed with scales; mediastinal vein ending at about half the length of the wing; subcostal ending at full five-sixths of the length; radial springing from the subcostal at before half the length of the wing; its two forks ending at the tip of the wing; enbital proceeding from the præbrachial transverse veinlet; subapical forked towards its tip; præbrachial, subanal, and anal complete; posterior margin excavated at the base. Abdomen slender, elongate, hairy, with eight segments. Legs slender, moderately long, pilose, unarmed; fore pair not remote from the others; coxae of moderate size; unguis very small; onychia almost obsolete. *Male.* Antennæ verticillate-plumose, the whorls from the base to the tips successively decreasing in length. Abdomen with two apical, slightly curved, foliaceous appendages, nearly as long as one of the segments. *Fem.* Antennæ verticillate-pilose; hairs short and few. Abdomen with two little apical curved hooks, which are not longer than a quarter of one of the segments.

"The larva of *Corethra plumicornis* is so beautifully transparent as to resemble a piece of crystal, and scarcely to be distinguished from the water in which it lives. It is vermiform, very long, with rather thicker thoracic segments. The head is small, eonical, turned upwards, furnished with two deflexed hooks, which

are articulated at the tip, and with two short palpi. The abdomen has a fan of hairs at the tip beneath. The pupa somewhat like that of *Culex*, but straight, and with pointed thoracic appendages.

"The larva of *C. culiciformis* much resembles that of *Culex pipiens* in form, but differs from it in its motions and station of repose. Instead of being suspended at the surface with its head downwards, it usually, like fishes, remains in a horizontal position in the middle of the water. When it ascends to the surface it is always by means of a few strokes of its tail, so that its motion is not equable, but by starts. It descends again gradually by its own weight, and regains its equilibrium by a single stroke of the tail. Its anus is furnished with a pair of oars or natatory laminæ, by which it rises to the surface. The trachæ appear to proceed from a pair of oblong vesicles of considerable size in the thorax, and towards the anus they form two other smaller ones."

*a.* Tarsi not dotted.

*b.* Antennæ with brown bands. Species 1.

*b b.* Antennæ without bands. Species 2.

*a a.* Tarsi dotted. Species 3.

1. **plumicornis**, F. E. S. iv. 246. 58 (1792); Meig.; Mcq.; Guér.; Zett.; Gim.—*cristallina*, D. G.—*lateralis*, Latr.; Panz.; Lam.; Meig. Kl. Zw.—*hafniensis*, Gmel. *Mas et Fem.* fusca, antennis testaceis fusco-cinctis, thoracis vittis duabus lateralibus pectoreque albidis, alis subcinereis, venis pedibusque testaceis, halteribus albis, abdomine pallide fusco; *Mas, antennarum plumis testaceis.* Long. 3; alar. 5 lin.

Brown. *Antennæ testaceous, with brown bands.* Thorax with a whitish stripe on each side. Pectus whitish. Wings slightly greyish; veins and borders thickly ciliated, the former testaceous. Halteres white. Abdomen pale brown, hairy. Legs pale testaceous, pubescent. *Male. Plumes of the antennæ testaceous.*

Generally distributed. (E. S. I.)

2. **culiciformis**, D. G. Ins. iv. 144. 16. pl. 23. f. 3-5 (1783); Latr.; Lam.; Meig.; Mcq.; Lehn. *Mas et Fem.* obscure fusca, antennis nigris, thoracis lateribus pectoreque pallide testaceis, alis subcinereis, venis pedibusque testaceis; *Mas, antennarum plumis nigris.* Long. 3; alar. 5 lin.

Dark brown. *Antennæ black.* Pectus and sides of the thorax pale testaceous. Wings slightly greyish; veins and borders thickly ciliated, the former testaceous. Halteres white. Abdomen brown, hairy. Legs testaceous, pubescent; tibiæ pilose. *Male. Plumes of the antennæ black.*

Not generally common, but sometimes appearing in great profusion. (E. S. I.)

3. **pallida**, F. E. S. iv. 245. 56 (1792); Gmel.; Panz.; Meig.; Meq.; Stæg.; Zett. *Mas*, pallide testacea, gracilis, *antennis albidis nigro-cinctis*, thorace vittis tribus testaccis, alis pedibusque albidis, venis halteribusque albis, vena transversa fuseo-nebulosa, abdominis segmentis nigro-marginatis, pedibus nigro-punctatis. Long.  $2\frac{1}{2}$ ; alar. 6 lin.

*Male*. Pale testaceous, slender, very pilose. Antennæ whitish, not thickly plumose, with a blackish band on each joint. Thorax with three darker testaceous stripes. Wings whitish, deeply ciliated along the hind border; veins white, very pubescent; transverse veinlets clouded with pale brown. Halteres white. Abdomen with a slender black band on the hind border of each segment. Legs whitish, pubescent, slender; femora with nine, and tibiae with seven, black bands.

Rare. In the British Museum. (E.)

### Genus V MOCHLONYX.

MOCHLONYX, Loew, Ent. Zeit. Stett. v. 121 (1844). *Corethra* p., Ruthé.

*Corethræ* valde affinis. Os longius. Os et rostrum coniunctim capite longiora. Rostrum proboscide vix brevius. Palpi 4-articulati, proboscide duplo longiores; articulus primus brevis; quartus tertio paullo longior. Antennæ 16-articulatæ; articuli primus et secundus breves, moniliformes; tertius sequentibus longior et crassior; ultimus linearis. Ungues graciles, acuti, dente graeili acuto basali.

Rostrum almost as long as the proboscis. Mouth along with the rostrum longer than the rest of the head. Palpi four-jointed, twice as long as the proboscis; first joint short; fourth a little longer than the third. Antennæ sixteen-jointed; first and second joints short, moniliform; third longer and thicker than those which follow; the single joints incrassated at the base, verticillate; they increase in length to the last, which is linear. Wings distinctly but finely veined; two furrowed veins, with their fork nearly equidistant from the base of the wing, and therefore that of the anterior further from the margin, as long as one-third of the wing; the branches more than twice as long as the petiole; brachial areolets eoterninious; the postbrachial irregular at the apex; posterior vein (subanal) inflected at an angle a little before the margin, and running along the margin towards the apex of the wing; this vein, as usual, doubled by a spurious one; one longitudinal vein behind it. Ungues slender, acute, one-third of the length of the fifth tarsal joint; a slender acute tooth at the base, half as long as the unguis. The wings are nearly as in *Corethra*, only the transverse veinlets rather more distant from the margin. The figure, development of the mesosternum, and antennæ much alike; the mouth longer and more deflected.

1. **effectus**, Hal. MSS. *Fem.* ferrugineus, subanreo-pubescent,

palpis fuscis, antennis fusco-ferrugineis, thoracis abdominisque suturis subfuscouscentibus, alis hyalinis apud costam subflavescenscentibus, femoribus posticis apices versus subfuscouscentibus. Long. 2; alar. 4 lin.

*Fem.* Ferruginous, clothed with yellowish down, almost of a golden gloss; the hairs on the abdomen longer. Front thickly clothed with yellowish hairs. Rostrum thickly clothed with fusco-ferruginous hairs. Palpi fuscous. Antennæ fusco-ferruginous, paler at the base. Sutures of the thorax delicately marked with fuscous; hind edge of the abdominal segments and lateral line darker. Pleuræ paler. Wings hyaline, a little yellowish towards the costa; veins pale fusco-ferruginous. Halteres pale, with a fuscous dot at the tip. Tentacles of the vagina small, with a dusky dot at the tip. Legs pale ferruginous, with fuscous hairs; hind femora before their tips very slightly embrowned.

Very rare. Two females in Mr. Clifton's collection. (E.)

### FAMILY VIII. PHLEBOTOMIDÆ.

PHLEBOTOMIDÆ, Hal. Ins. Brit. Dipt. i. 7 (1851). *Tipulariæ noctuæ-formes*, Meig. *Psychodites*, Newm. *Phalenoïdes*, Mcq. *Psychodides*, Zett. *Tipulariæ p.*, Agass. *Phlebotomini*, Rond. *Tipularia Galli-cola* *Polyneura* (*Psychodina*), Loew.

Ocelli nulli. Mesothoracis scutum integrum. Alæ ovatae aut lanceolatae, deflexæ aut divaricatae; vena costalis circa marginem posticum attenuata; venæ apicales plus quam sex.

Ocelli nonc. Scutum of the mesonotum undivided. Wings and halteres developed. Wings ovate or lanceolate, deflected or divaricated; costal vein attenuated round the hind margin; veins in their last subdivisions more than six.

Some of the foreign species of this Family are blood-suckers, and allied to the *Culicidæ*; others are of larger size, and allied to the *Tipulidæ*. I am indebted to Mr. Haliday for all the following characters of the genera and species of this Family. The mandibles are lancet-like in all the British genera, but in *Phlebotomus* they, like the maxillæ, are lancet-like. The ossiculi of the wings, and the alulæ, are unusually protruded, the latter with a strong secondary crease, which, with the abrupt termination of the ossicles, determines a flexible fold near the base of the wing, which thus often hangs down by the sides in the dead insect. The tentacles are horny, and applied flat to each other, usually pointed, and forming a boreæ like that of *Tipulidæ*. The male has a double pair of grapplers, each two-jointed, and armed at the end with a claw (sometimes compound), the lower pair largest.

*forming a pale fuscous fascia before the middle, across which runs an angular mark, white in some lights, as well as six or seven spots along the margin at the apex of the veins; three veins on the costa bearing a black dot each, also three of the alternate veins on the interior margin; cilia pale fuscous. Legs unspotted.*

The larva is figured by Bouché and by Perris. "Respiratory aurielles of the pupa filiform-curved, communicating with the main trachea by a dilated cylindrieal portion of the latter. In the larva ready for transformation they may be seen, through the skin, forming an interrupted ring round the first part of the prothorax, beginning close to the spiracle and bent down till they nearly meet below, the thickened part of the trachea being also visible. According to my observations, the main tracheæ rise from the prothoraeic spiraeles to the anal points without any intermediate lateral spiraeles—as Perris has already stated, differing from Bouehé. I found in the larva a pair of glands (ending in a filament at each end) lying loose among some elongate, subcylindrie, white, fatty masses in the neighbourhood of the small intestines, nearly as in *Tipula*. These are the rudiments of the reproductive organs."—*Hal.*

Not rare. (E. S. I.)

## Genus II. PERICOMA.

PERICOMA, Hal. MSS. *Psychoda* p., Meig.; Meq.; Zett. *Trichoptera* p., Meig. Kl. *Tipula* p.? L.; Gmel.; Lam.

Proboscis brevior, non compressa. Labrum breve. Maxillæ obsoletæ. Antennæ moniliformes. Alæ maris et fœminæ æquales.

Proboscis shorter than in *Psychoda*, not compressed. Labrum short. Maxillæ obsolete. Antennæ moniliform. Wings tense. Larva with rows of hairs; inhabits water, bent into a ring, the tufts of curved hairs detaining a covering of mud.

a. Forked veins unequal. The anterior fork of the radial vein much more distant from the base of the wing than the posterior fork. Wings pointed at the end of the second simple intermediate vein (*i. e.* the first externo-medial). (Wings as in *Psychoda*.) Species 1-3. [The first is the only species of which I have examined the mouth detached, so that probably some of them should be placed with *Psychoda*, agreeing in the wings.]

a a. Anterior fork nearest the base of the wing. Prebraehial areolet closed distinctly at about one-fourth of the length of the wing, nearly opposite the anterior fork. Wings pointed at the end of the first intermediate simple vein (*i. e.* cubital). Antennæ with the first joint elongate. Species 4.

*a a a.* Forks nearly equidistant from the base of the wing; the præbrachial areolet usually very short and indistinct; the wing either rounded at the tip or the point between the two intermediate simple veins; first joint of the antennæ little longer than the others.

*b.* Wings rather pointed (laneeolate) (or ovate-laneeolate). Smaller species. Species 5-7.

*b b.* Wings rounded at the tips, ovate. (Joints of the antennæ after the second less distinctly knotted or petiolated, being rather ovate; the whorls spreading.) Species 8-11.

1. **lucifuga**, n., Hal. MSS. *Testacea, parum hirta, antennis petio-lato-globosis corporis longitudine, alis subhyalinis immaculatis, pedibus pallidis, tarsis fuscis.*

Rather longer than *P. phalænoides*. *Ruso-testaceous, abdomen and halteres brownish. Legs paler; tarsi and tips of the tibiæ brownish. Antennæ with the first two joints short, globose, each of the remainder with a dusky globose base and a long pale petiole; the whorls of hairs long and somewhat incurved, but lax. Pubescence not abundant, so that the wings appear obscurely hyaline, with dark fringed veins and margin, but without spots.*

Inhabits shady moist spots in woods. In September, at Holywood and at Blarney. (I.)

2. **soleata**, n., Hal. MSS. *Cervino-hirta, alarum ciliis fusco-micantibus basi antice et apice pallidioribus, tarsorum articulis exterioribus albo-micantibus.*

Resembles *P. calceata* with respect to the four exterior joints of the tarsi, which are glossed with yellowish-white, but the acute wings, etc., do not agree with Zetterstedt's description of that species. *It is pretty thickly clothed with fawn-coloured hair,—a couple of rather indistinct fuscous tufts towards the fore edge of the wings, viz. at the fork of the radial, and above the opposite fork of the externo-medial (second); the long cilia shift in colour to dusky, except at the apex and the humeral tuft at the base. Antennæ shorter than in the preceding species.*

Rare. In Mr. Dale's collection. (E.)

3. **bullata**, n., Hal. MSS. *Cervino-hirta, abdomine palpis pedibusque plumbeo-micantibus, antennarum verticillis crateriformibus margaritifero-micantibus annulatis, alis cinereo-hirtis, venis posterioribus alternis nigro-ciliatis.*

Scarcely larger than *P. phalænoides*. *Plumbeous. Vertex, front, dorsum of the thorax, and base of the wings in front with fawn-coloured hairs. Whorls of the hairs of the antennæ very coarctate, hiding the joints, curved inward, eup-shaped, like a bubble, and shifting with opaline tints like a soap-bubble. Palpi and legs thickly clothed with fine slender plumbeous-shining scales. Palpi moderately long; second, third, and fourth joints of nearly equal length. Antennæ (thirteen-jointed?) nearly as long as the wings. Wings with cinereous hairs; radial vein*

9. **nubila**, Meig. ; Meig. Zw. i. 107. 9 (1818) ; Zett.—*phalænoides*, Scop.—*ciliatus*, Geoffr.—*hirta*, D. G. ; Retz ; Latr.—*bombyciformis*,\* Schr. *Fusca, cervino-hirta, alis ovatis fuscis albido-maculatis, tibiis apice tarsisque albo-annulatis; Mas, fasciculo frontis erecto aterrimo antice niveo.*

*Head, thorax, and abdomen clothed with fawn-coloured hairs (or whitish on the head). Wings with brown hair; faint brownish dots at the forks and at the end of veins; a whitish spot near the base, two at the anterior margin, one before and one beyond the middle, and several smaller ones towards the hind margin; fringe fuscous, but dingy-whitish towards the end at the tip of the wing (not throughout, as in *Ulomyia hirta*). Legs fuscous, with long whitish hairs; the end of the tibiae, the base and the tip of the first basal joint, and the whole of the third on one side, whitish-glossed. Male.* With a recurved spreading tuft of hairs on the front, very conspicuous from the colour being snow-white before and intense black behind.

Very common; reared from larvæ found on fallen leaves immersed in the water of pools or slow streams. (E. S. I.)

10. **fusca**, Meq. Tip. N. Fr. 110. 4 (1824) ; H. N. D. i. 165. 6 ; Meig.—*phalænoides*, Var. ? Schr. *Fuliginosa, alis ovatis postice atro-ciliatis, antennarum basi palpisque atro-hirtis.*

Almost as large as *P. nubila*. Clothed with sooty hairs, the dark tufts at the forks of the wing scarcely marked, but the two hindmost veins of the margin behind them ciliated with deep black hairs; the tuft at the base of the costa hoary. Forks at about two-fifths of the length of the wing. Antennæ with fawn-coloured whorls of hair, the first two joints and the palpi thickly clothed with deep black hairs (in the male only ??).

Not common. (I.)

11. **calceata**, Meig. Zw. vi. 272. 11 (1830) ; Zett. *Nigro-fusca, griseo-villosa, alis ovatis fuliginosis fimbria apicis tarsorumque articulis extremis albidis.*

*Blackish-brown, with cinereous hairs. Wings oval, smoky; fringe and the apical joints of the tarsi whitish.*

“ Resembles the preceding species a good deal, but the fringe at the tip of the wing is whitish, and the exterior joints of the tarsi are glossed-whitish. My specimen, given me by Mr. Dale, is too much injured to afford additions to Meigen’s description.”

—Hal.

---

\* “ I have cited this, on account of the carriage of the wings, rather than *Tipula hirta*, Schr. (Fn. B. iii. 82. 2348). This last therefore remains uncertain; also *T. phalænoides*, Schr. (Ins. Austr. 434. 883; Fn. B. iii. 82. 2349), since he appears to have understood *phalænoides*, L., under his *nervosa*. The diagnosis of *phalænoides*, Schr., agrees with *hirta*, Latr., *ciliatus*, Geoffr., but, as I have said, the contrast he expressly draws as to carriage of wings seems to exclude it from the synonyms of *nubila*, Meig.” —Hal.

Genus III. **ULOMYIA.**

**ULOMYIA**, Hal. *Saccopteryx*, Hal.; Curt. B. E. 745: (name preoccupied in Mammalia, Illiger.) *Tipula* p., L.; F. E. S. *Psychoda* p., Meig. Proboscis brevis, non compressa. Labrum breve. Maxillæ obsoletæ. Antennæ moniliformes. Alæ sinu medio convexo. Proboscis shorter than in *Psychoda*, not compressed. Labrum short. Maxillæ obsolete. Antennæ moniliform. Wings tense. *Male*. Wings with a coriacaceous poueh.

The larva lives in clear running water, and has, like a dorsi-branchial *Annelid* or *Phyllocoete*, down the back two rows of acute, lancolate, foliaceous branchia-like appendages; each row consists of three pairs on each segment, viz. a pair on each of the three folds or subdivisions of the segment. Otherwise most like the larva of *Pericoma*.

1. **hirta**, L. F. S. ii. 1772 (1761); F.—*fuliginosa*, Meig. Nigro-fusea, alis apice maculis tribus albicantibus. Long.  $1\frac{1}{4}$ ; alar. 3 lin. Blackish-brown. Wings with three apical whitish spots.

Not rare. (E. S. I.) Fabrieus expressly mentions the white tip of the wing (in *Pericoma nubila* the cilia of the apex are whitish at the end only, dusky at the base); Linnæus does not; but the chequered black and white suits this species better than *P. nubila*. Reared from larvae found on fallen leaves lying in a waterfall of a clear rivulet.

Genus IV. **TRICHOMYIA.**

**TRICHOMYIA**, Hal.; Curt. Brit. Ent. 745 (1839). *Phalænomyia*, Loew. *Psychoda* p., Roser; Zett.

Oculi rotundi, remoti. Antennæ 12-articulatæ, articulis obconicis. Alæ apice rotundatae; areolæ brachiales elausæ; vena postrema abbreviata.

Antennæ filiform; first and second joints thick; the rest longer, somewhat conical. Wings with a complete discal areolet; five external areolets; second petiolated; third complete; brachial areolets not exceeding the first third of the wing; costal areolets half divided; veins very hairy. Valves of the oviscapts broad, ovate.

1. **urbica**, Hal.; Curt. B. E. 745. 8 (1839).—*aurea*, Zett.—*flavescens*? Roser. *Fem.* fusea, nigro-hirta, fronte thorace et abdominis basi flavo-hirtis, alis flaveseentibus nigro-bifasciatis, halteribus pallidis apice nigro-fuseis, femoribus tibiisque flaveseentibus.

*Fem.* Brown. Front, thorax, and base of abdomen clothed with

observed. The larva is probably to be looked for in running waters.

"The other genus *Dixa*, referred by Meigen and Zetterstedt to the *Mycetophilidæ*, by Macquart, Westwood and Loew to the *Tipulidæ*, and by Rondani to his *Trichocerinæ* (a subdivision of the latter group), differs from the first by the want of ocelli, from the latter by the undivided mesonotum, deep mesosternum, pectinated unguis of anterior legs, broad, rounded tentaeles of the vagina, etc., and may be considered of dubious place, until the characters of the larva are known. Westwood (Mod. Class. ii. 527, note) and Haliday have indeed supposed that Degcer's figures, Mem. tom. vi. pl. 24. f. 1-11, are meant to represent a *Dixa* and its metamorphosis; but although the setaceous antennæ, slender legs, and conspicuous forked vein near the tip of the wing may suggest such a referencee, the venation of the wing, as represented, is more like that in *Anisomera*. Roser's account (Wurt. Zwcyfls.) of the metamorphosis of this last, however, does not agree with Degeer's of the insect in question; and the express character given of "hairy veins" scarcely leaves any alternative but to suppose it meant for an *Erioptera*."—Hal.

A. Antennæ shorter than the head. 1. ORPHNEPHILA.

B. Antennæ setaceous, shorter than the head. 2. DIXA.

### Genus I. ORPHNEPHILA.

ORPHNEPHILA, Hal. Zool. Journ. v. no. xix (1831); Westw.; Rond. *Thaumalea*, Ruthé; Loew. *Chenesia*, Meq.; Meig.; Zett.

Corpus parvum, oblongum, glabrum. Caput parvum. Ocelli rotundi. Proboscis brevis. Palpi 4-articulati, elongati; articuli cylindrici, primus brevissimus; secundus crassior, ovatus; tertius et quartus paullo longiores. Antennæ filiformes, breves, basi crassæ. Thorax robustus, gibbus. Scutellum medioere. Alæ nudæ, parallelæ, sat latæ, basi angustatae, apice rotundatae. Abdomen segmentis 7, subcylindricum, sat crassum, thorace paullo angustius et fere duplo longius. Pedes subæquales, medioeres, simplices, nudi, inermes; coxae breves; unguis et onychia parva; *Mas*, oculi in fronte connexi. Anus magnus, valvatus.

Body oblong, rather small, nearly smooth. Eyes round, large, meeting on the front, but not on the under side. Proboscis short, with oblong labella. Labrum still shorter, stout, conical; the lateral edges sinuated or toothed; the tongue concealed. Palpi more than twice as long as the antennæ, five-jointed; first joint shortest; second thickest, ovate; the others gradually more slender; the fifth not elongated. Antennæ near the mouth, shorter than the head, seeming composed of

two joints (first globose; second ovate, with a terminal arista, which is a little longer than the first and second together), but under a good lens they are found to be ten-jointed; the first thickest, globose; second, third, and fourth compact into an oval mass; the rest slender; fifth short; sixth and following, to the tenth, linear, pubescent; tenth with two longer hairs near the tip. Thorax robust, gibbous; scutellum of moderate size. Wings oblong, with an obtuse anal angle; no distinct axillary lobe; the ambient vein faint round the hind margin; of the longitudinal veins two end in the costa, two about the apex, three in the hind margin; there is an arcolet closed before the middle of the wing, with very irregular outward limit; it is divided longitudinally by an obsolete vein (the first part of the præbrachial vein), and represents the confluent brachial areolets (nearly as in *Bolitophila*). Taking the mediastinal vein to be obsolete, and the first longitudinal vein ending before the middle of the costa to be the subcostal, we shall have a simple radial ending beyond the middle of the costa, and a simple cubital ending near the apex of the wing, these two connected by a perpendicular veinlet beyond the end of the præbrachial arcolet; three simple extero-medial veins, two from the end of the præbrachial, one from the pectoral areolet; subanal vein produced from the posterior apical angle of this last areolet, running to the margin not far beyond the anal angle; anal and axillary veins very faint or obsolete; præbrachial areolet longer than the pectoral, but almost confounded with it. Halteres elongated; club rather large. Abdomen with seven segments, nearly cylindrical, moderately thick, a little narrower than the thorax, and about twice its length. Legs simple, bare, unarmed, of moderate and nearly equal length; coxae short; tibiae without spines; tarsi rather long, the foremost much longer than the tibia; penultimate joint shortest, emarginate at the tip, nearly obcordate. Ungues curved, simple, acute. Onychia dilated. Empodium inconspicuous. *Male*. With a double forceps, the outer very stout, two-jointed; first joint broad, subovate; second slender, culthiform, acute; inner forceps slender, strongly incurved, armed at the tip with an inflected claw, and with a smaller spine inside, some way before the tip. *Fem.* Tentacles of the vagina broad, rounded at the tip.

1. **testacea**, Ruthé, Isis, 1831. 1211 (1831); Loew; Mcq.; Meig.; Zett.—*devia*, Hal.—*obscura*, Zett. Picea, palpis antennisque nigris, alis cinereis, pedibus testaceis. Long.  $1\frac{1}{2}$ ; alar. 4 lin.

Piceous. Palpi and antennæ black. Wings grey; veins black. Halteres and legs testaceous.

Not common; frequents the shady banks of streams. (E. I.) "Connor hill, near Dingle, almost one thousand feet high; not seen higher."—*Hal. MSS.*

## FAMILY X. TIPULIDÆ.

TIPULIDÆ, Hal. I. B. D. i. 7 (1851). *Tipulariæ Terricolæ* p., Latr.;  
Mcq. *Tipulariæ rostratæ* p., Meig.

Mesothoracis scutum sutura transversa angulosa.

Scutum of the mesonotum with an angular transverse seam.

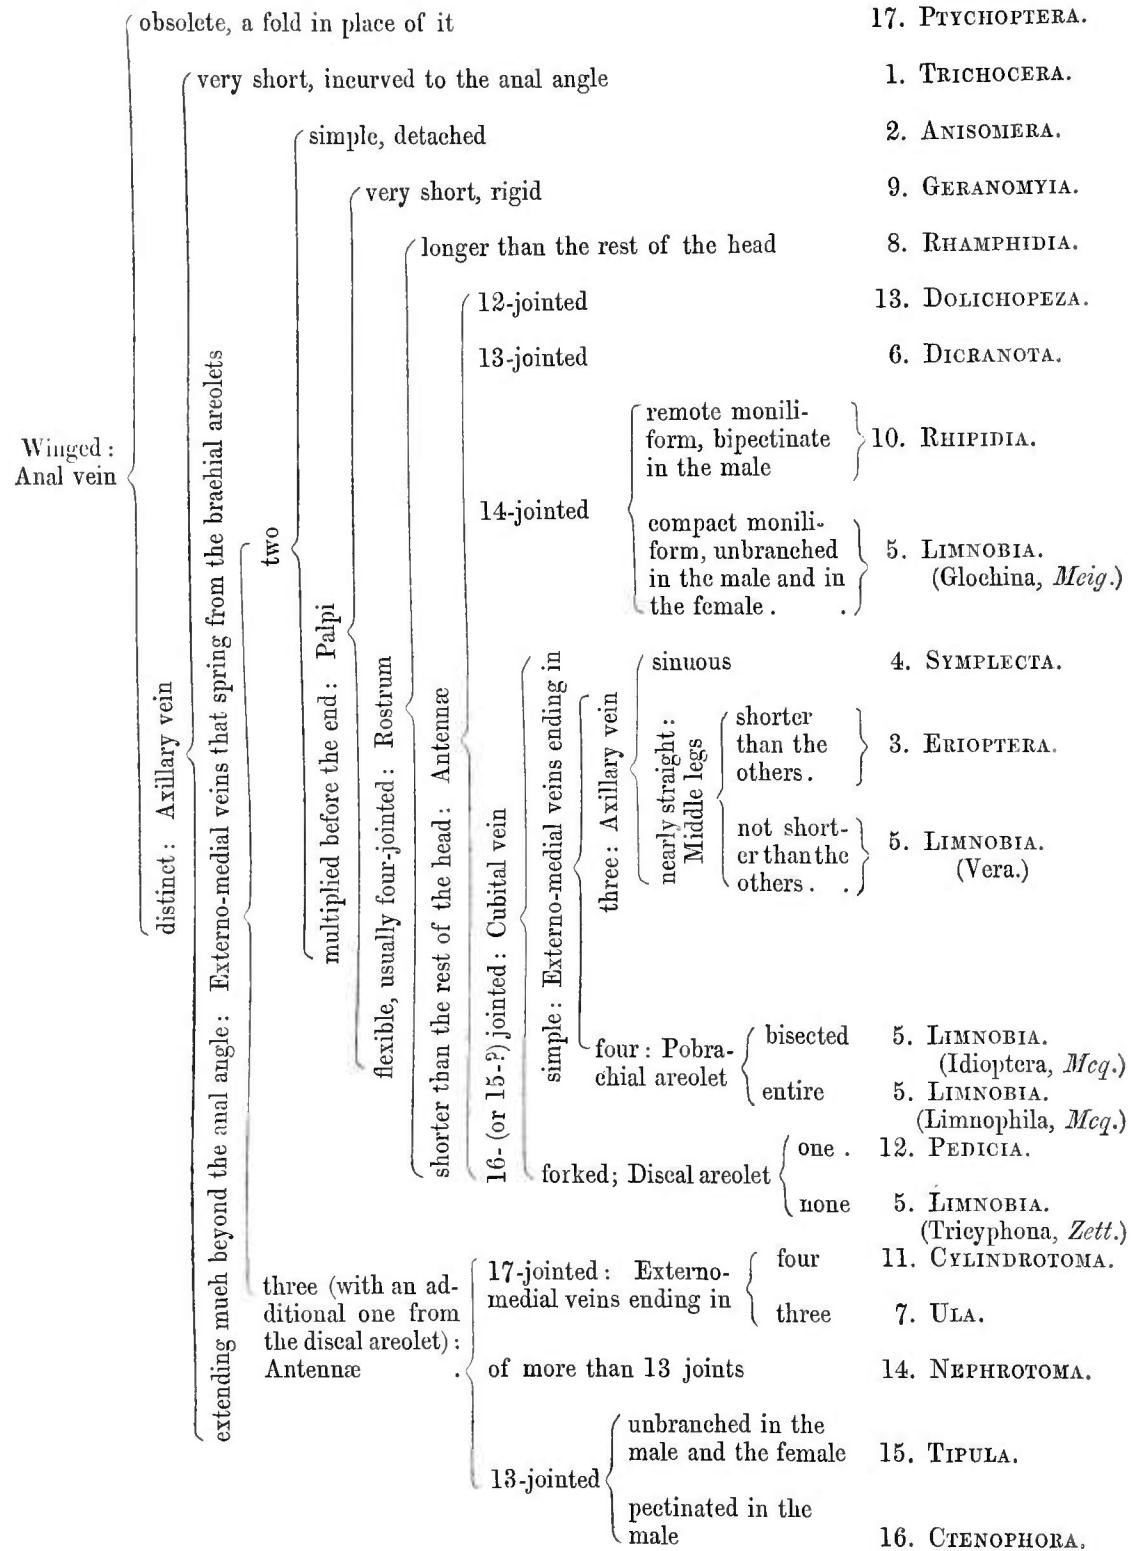

The species of this Family are called Crane-flies, or Daddy Long-legs, and are at once distinguished by the length of their legs. The larvæ feed on roots, fungi, wood, and decaying vegetable substances, and in a few cases are aquatic.

The flies much exceed all the other *Nemocera* in size and in variety of structure, and very many of the exotic genera are quite distinct from the European forms. The genus *Chionea* is not only remarkable in being wingless, but also from its occurring only on snow in winter, and most often on new-fallen snow. The head is generally more or less prolonged in front. The fourth joint of the palpi in some genera is long, flexible, and as it were jointed. The antennæ are filiform or setaceous, occasionally verticillate-pilose or pectinated, sometimes of great length in the male. The transverse suture of the mesothorax is peculiar to the Family, and the metathorax is often elongated. The wings are long and narrow, and generally contain a discal areolet. The abdomen and the legs are very long and slender, and the female has a horny pointed oviduct. The peculiar structure of the Family has most development in the genus *Tipula*.

Mr. Haliday has kindly contributed the synopsis of the genera of *Tipulidæ*, and I am also indebted to him for some of the following notes. I have reunited to *Limnobia* the genera which have been separated from it; for in some cases nearly allied species have been placed in different genera, and *Limnobia*, without them, would still comprise several equivalent or more distinct groups than those which have been removed from it; the synopsis is accordingly altered so as to indicate those genera without adopting them. *Erioptera lateralis*, Mcq., is included in *Limnobia*, as it appears to be most nearly allied to that genus, though its middle legs are a little shorter than the others.

Wingless

CHIONEA.\*

Genus II. **ANISOMERA.**

**ANISOMERA**, Hoffm. Meig. Zw. i. 210 (1818); Meq.; Zett. *Hexamoma*, Latr.; Lam. *Perenocera*, Curt.

Corpus elongatum, mediocre, sublæve. Caput rotundum, sessile; frons latissima. Oculi parvi, oblongi, remoti. Proboscis brevis. Palpi 4-articulati, exserti, incurvi; articuli æquales. Antennæ 6-articulatæ, porrectæ, subfiliformes; articulus primus cylindricus; secundus cyathiformis; tertius et sequentes setacei, subpubescentes, hic longus. Prothorax brevissimus. Thorax sat convexus. Scutellum mediocre. Metathorax brevis. Alæ incubentes, mediocriter latæ. Abdomen elongatum, segmentis octo. Pedes longiusculi, sat graciles, incermes, fere nudi; coxae breves; tibiæ posteriores calcaribus brevissimis. *Mas.* Antennæ longiorcs. Abdomen apice obtusum, forcipe brevi. *Fœm.* Antennæ breviores. Abdomen stylis analibus rectis parvis.

Body elongated, dull, nearly smooth, of moderate size. Head round, sessile; front very broad. Eyes small, oblong, remote. Proboscis short. Palpi four-jointed, exserted, curved downward; joints of equal size. Antennæ six-jointed, porrect, subfiliform; first joint cylindrical; second cyathiform; the following joints setaceous, minutely pubescent, the third long. Thorax moderately convex. Prothorax very short. Scutellum of middle size. Metathorax short. Wings incubent, long, lanceolate, rather narrow; mediastinal vein ending at a little before or beyond two-thirds of the length of the wing. Subcostal ending at four-fifths or five-sixths of the length, connected with the radial by a transverse veinlet from the angle close to its tip; radial and cubital springing from a common pectiole, which nearly or quite equals them in length, and proceeds from the subcostal at more or less before half the length of the wing, and forms an angle close to its base; cubital connected at one-fourth of its length with the extero-medial by a transverse veinlet, the middle of which emits another extero-medial, and in a line with it there is a veinlet between the extero-medial and the subanal, where the latter forms an angle to the hind border; anal and axillary complete; no discal arcolet. Halteres of moderate length. Abdomen elongated, with eight segments. Legs moderately long and slender, nearly bare, unarmed; coxae short; posterior tibiæ with very short spurs. *Male.* Antennæ longer. Abdomen obtuse at the tip, with a short forceps. *Fœm.* Antennæ shorter. Abdomen with straight short anal styles.

Inhabits the banks of rivers. The larva lives in mud.

- a. Antennæ of the male as long as the body; of the female half the length of the thorax. Species 1.
- a. Antennæ of the male hardly more than half the length of the thorax; of the female less than half the length of the thorax. Species 2.

1. **nigra**, Latr. Gen. Curt. iv. 260 (1809); Lam.; Meq. Nigra,

alis cinereis, pedibus ferrugineis, femoribus tibiisque apiee tarsisque piceis. Long. 4-5; alar. 11-12 lin.

Black. Wings grey; mediastinal vein ending at a little beyond two-thirds of the length of the wing; subcostal ending at five-sixths of the length; radial and cubital veins as long as their common petiole, which proceeds from the subcostal at a little before half the length of the wing; radial forked before half its length; its fore fork connected by a veinlet close to the base with the subcostal. Halteres piceous. Legs dull ferruginous; tarsi and tips of the femora and of the tibiæ piceous.

Inhabits the banks of streams among the hills, and occurs most frequently in the north of England and in Scotland. Rare. (E. S.)

2. **vittata**, Meig. Zw. vi. 292. 4 (1830); Gim.; Zett. — *fusci-pennis*, Curt. Nigro-einerea, thorae vittis duabus canis, alis subeine-reis, venis infuscatis, pedibus piceis. Long. 3-3½; alar. 7-8 lin.

Cinereous-black, dull. Thorax with two hoary stripes which are forked hindward. Wings greyish; veins black, slightly clouded; mediastinal vein ending at a little before two-thirds of the length of the wing; subcostal ending at four-fifths of the length; radial and cubital veins rather longer than their common petiole, which proceeds from the subcostal at before half the length of the wing; radial forked at some distance beyond its junction with the subcostal, its fore fork very short. Halteres testaceous. Abdomen pilose on each side. Legs piceous.

Not rare in the north of England, and in Scotland. (E. S.)

### Genus III. ERIOPTERA.

ERIOPTERA, Meig. Klass. Zw. (1804); F.; Mcq.; Curt.; Westw.; Stæg.; Zett.; Ros. (V.) *Tipula* p., L.; F.; Geoff.; Gmel. *Limonia* p., Latr.

Corpus gracile, elongatum, subpubescens, mediocre aut parvum. Caput parvum, globosum. Oculi rotundi, remoti. Proboscis brevis. Palpi 4-articulati, cylindrici, incurvi, pubescentes; articuli subæquales. Antennæ 16-articulatae, porrectæ, simplices, subpilosæ, filiformes aut fere setiformes; articulus primus cylindricus; secundus cyathiformis; tertius et sequentes parvi, ovati. Alæ incubentes, parallelæ, sat longæ, latitudine mediocres. Abdomen cylindricum aut fusiforme, segmentis octo, subpubescens. Pedes longi, graciles, inermes, tibiæ subpubescentes; tibiæ ecalcaratæ. *Mas.* Abdomen apice obtusum. *Fem.* Abdomen stylis duobus apicalibus corneis. Body of moderate or small size, slender, elongated, slightly pubescent, pale, or cinereous. Head small, globose. Eyes round, remote. Proboscis not elongated. Palpi four-jointed, exserted, cylindrical, pu-

stout, very minutely pubescent; tips of the femora and of the tibiæ brownish; tarsi brown.

Not rare. (E.)

6. **lineata**, Meig. Zw. i. 111. 7 (1818); Mcq.; Gim.; Stæg.; Ros.; Zett.—Var. *apparens*, Walk. Cinerea, palpis antennisque nigris, alis subcinereis, venis nigris, stigmate fusco, halteribus albidis aut testaceis, pedibus nigris, femoribus tibiisque plus minusve testaceis apice nigris.

Cinereous. Palpi and antennæ black. *Wings grey; veins black, testaceous at the base; stigma brown.* Halteres whitish. Legs black; femora dingy testaceous, blackish towards the tips. Var.  $\beta$ . Pectus whitish. Halteres testaceous. Legs testaceous; tarsi and tips of the femora and of the tibiæ blackish.

Generally distributed. (E. S. I.)

7. **grisea**, Meig. Zw. i. 112. 9 (1818); Mcq.; Stæg.; Zett. Cinerea, antennis fuscis basi fulvis, thorace vittis duabus flavescentibus, alis subcinereis, venis fuscis pubescentibus, halteribus albidis, abdominis apice pedibusque fulvis, his sat validis, femoribus tibiisque apice tarsisque fuscis.

Grey. Antennæ brown, tawny at the base. Thorax with a yellowish streak on each side. Wings greyish; veins brown, pubescent. Halteres whitish. Tip of the abdomen tawny. Legs tawny, rather short and stout; tarsi and tips of the femora and of the tibiæ brown.

Not common. (E.)

8. **diuturna**, Walk. C. D. B. M. i. 54 (1848).—*hæmorrhoidalis*?; Zett. Cinerea, antennis nigris, thoracis lateribus pectoreque fulvis, alis subfuscis, venis non pubescentibus; *Mas*, pedibus fuscis, tibiis fulvis apice fuscis; *Fæm.* pedibus fulvis, femoribus tibiisque apice tarsisque fuscis. Long. 2; alar. 5 lin.

Grey. Antennæ black, tawny at the base, shorter than the thorax. Sides of the thorax and pectus tawny. *Wings slightly tinged with brown; stigma pale brown; veins and halteres brown.* Male. Legs brown; tibiæ dark tawny with brown tips. Fem. Legs tawny; tarsi and tips of the femora and of the tibiæ brown.

Not common. In the British Museum. (E.)

9. **trivialis**, Meig. Zw. i. 112. 8 (1818); Mcq.; Stæg.?; Ros.; Zett. Cana, palpis antennisque nigris, thorace vittis duabus testaceis, alis subcinerascentibus, venis pallide fuscis apice ciliatis, stigmate fusco, halteribus albis, abdomine fusco, pedibus testaceis, femoribus tibiis tarsisque apice fuscescentibus. Long. 3; alar. 7 lin.

Hoary. Palpi and antennæ black. Thorax with a slender testaceous stripe along each side. *Wings very slightly greyish; veins pale brown, fringed towards the tips; stigma pale brown.* Halteres white. Abdomen brown, with a slight hoary tinge. Legs dull testaceous, moderately long and slender; tips of the femora, of the tibiæ, and of

the tarsi brownish. *Fem.* Tip of the abdomen testaceous. Var.  $\beta$ . Thorax testaceous, with a black stripe. Wing-veins and halteres testaceous.

Generally distributed. (E. S. I.)

10. **tænionota**, Meig. Zw. i. 111. 5 (1818); Mcq.; Gim.; Stæg.; Zett. D. S.—*analis*, Zett. I. L. Fulva, nonnunquam cana aut cinerea, palpis antennisque nigris, *alis subcinerascentibus*, abdomine nonnunquam fuscescente, pedibus testaceis, femoribus tibiis tarsisque apice plus minusve fuseis aut nigris. Long. 3; alar. 7 lin.

Tawny. Palpi and antennæ black. Thorax with a slight, short black stripe in front; sides of the thorax, pectus, and metathorax whitish-testaceous. Wings *hardly greyish*; veins brown, fringed with pale hairs towards the tips. Halteres whitish, with brown knobs. Abdomen pale brown, tawny beneath. Legs dull testaceous, rather long and slender; tarsi with black tips.—Var.  $\beta$ . Hoary. Head, palpi, and antennæ black. Thorax with two slender brownish stripes. Veins of the wings black, testaceous at the base. Halteres whitish. Tarsi and tips of the femora and of the tibiæ brown.—Var.  $\gamma$ . Thorax hoary, tawny about the base of the antennæ. Halteres whitish. Legs brown.—Var.  $\delta$ . Hoary. Disc of the thorax cinereous. Wing-veins and halteres pale testaceous. Abdomen blackish-grey, testaceous at the tip. Tips of the tibiæ and of the tarsi brown.—Var.  $\epsilon$ . Whitish. Wing-veins pale. Halteres white. Abdomen cinereous. Tips of the femora, of the tibiæ, and of the tarsi black.

Generally distributed. (E. S. I.)

11. **fuscipennis**, Meig. Zw. i. 111. 6 (1818); Mcq.; Gim.; Stæg.; Zett. Cinerea aut ferruginea, palpis antennisque nigris, *alis subcinereis*, *venis fuscis ciliatis*, halteribus pallide testaceis, abdomine fusco, pedibus testaceis sat validis, femoribus tibiis tarsisque apice fuscescentibus. Long. 3; alar. 7 lin.

Cinereous or dull ferruginous. Palpi and antennæ black. Wings *slightly greyish*; veins brown, thickly fringed with brownish hairs; borders ciliated. Halteres pale testaceous. Abdomen brown. Legs dull testaceous, rather stout; tips of the femora, of the tibiæ, and of the tarsi, brownish. *Fem.* Tip of the abdomen testaceous.

Not rare. (E.)

12. **nodulosa**, Mcq. D. N. i. 108. 5 (1827); Meig.—*Hederæ*, Curt. Cinerea, capite pectoreque albidis, palpis antennisque nigris, *his longiusculis*, *alis subcinereis*, *venis nigris*, *stigmata fusco*, halteribus albis, abdomine cinereo, pedibus fuscis, femoribus basi fulvis, tarsis apice nigris.

Cinereous. Head and pectus whitish. Palpi and antennæ black, the latter rather long. Wings grey; veins black; stigma brown. Halteres white. Abdomen cinereous. Legs brown; femora tawny towards the base; tarsi black at the tips.

Not common. (E.)

*limpidis, venis nonnullis fusco-limbatis, abdomine nigro-cinereo, pedibus testaceis.* Long.  $2\frac{1}{2}$ -3; alar. 5-6 lin.

Hoary. Palpi and antennæ black, testaceous at the base. Thorax with four brown stripes, the outer pair short. Wings nearly limpid, clouded with brown by the costa at the base of the vein, and from two-thirds of the length to the tips, and also on the transverse veinlets. Halteres testaceous. Abdomen blackish-grey; tip testaceous. Legs testaceous.

Not rare. (E. S. I.)

---

### Genus V. **LIMNOBIA.**

**LIMNOBIA**, Zett. D. S. x. 3802 (1851). *Tipula* p., L.; F.; Schr.; Gmel. *Limonia*, Latr.; Meig. Klass. *Limnobia* p., Meig.; Schumm. *Limnobia*, *Limnophila* et *Idioptera*, Mcq.; Stæg. *Limnobia* et *Glochina*, Meig. *Limnobia* et *Idioptera*, Hal. *Limnobia* et *Tricyphona*, Zett.

Corpus elongatum, sublineare, fere lœve, magnum aut mediocre, non-nunquam parvum. Caput parvum, obpyriforme. Oculi rotundi, remoti. Proboscis modice longa. Palpi 4-articulati, cylindrici, crassiusculi, pubescentes, incurvi; articuli subæquales. Antennæ 15- aut 16-articulatæ, porrectæ, simplices, basi subincerassatæ, apice setaceaæ; articulus primus crassus, cylindricus, longiusculus; secundus cyathiformis, crassior; tertius et sequentes rotundati, subpilosæ. Thorax ellipticus. Alæ longæ, angustæ, incumbentes. Abdomen segmentis octo, elongatum, subdepressum. Pedes longi, inermes, subpubescentes; coxae breves; tibiæ posticæ bicalcaratæ. *Mas.* Abdomen apic obtusum, forcipe brevi lata dentata. *Fem.* Oviductus stylis duobus corneis acutis.

Body large, or of middle size, rarely small, elongated, almost smooth, nearly linear, cinereous, lurid yellow or testaceous, rarely black. Head small, obpyriform. Eyes round, remote. Proboscis moderately lengthened. Palpi four-jointed, cylindrical, pubescent, rather thick, curved downward; joints of nearly equal length. Antennæ fifteen or sixteen-jointed, porrect, simple, rather thick at the base, setaceous at the tips, generally but little longer than the head; first and second joints bare; first thick, cylindrical, rather long; second cyathiform, rather thick; the rest rounded, slightly pilose, successively decreasing in size. Thorax elliptical. Wings incumbent, long, narrow, most often bare, occasionally slightly pilose towards the tips. Abdomen with eight segments, elongated, slightly depressed (especially in the male). Legs long, minutely pubescent, unarmed; coxae not elongated; posterior tibiæ with two minute apical spurs. *Male.* Tip of the abdomen obtuse, with a short, broad, denticulated forceps. *Fem.* Oviduct with two, horny, acute styles, forming a vagina.

In the following descriptions the externo-medial veins are men-

tioned as three in number in all the species. The larvæ of most species live in the earth or in fungi, but that of *L. replicata* is aquatic, and its body is furnished with numerous long filamentous processes which appear to be internally supplied with air-tubes. It is furnished with anal claws, which in conjunction with its annular tension and relaxation, and the hooks of its mouth, assist it in walking over the aquatic plants. It can withdraw its head so completely that the anterior margin of the first segment of the body closes the orifice. The pupa has dorsal hooks on the three or four terminal abdominal segments. The species may be arranged in the following groups:—

- a.* Wings with a discal areolet.
- b.* First externo-medial vein forked. Radial vein forked.
- c.* Fork of the first externo-medial vein with a petiole between it and the discal areolet.
- d.* Two veinlets between the subanal vein and the third externo-medial.—Meig. Zw. i. 121. Div. C. pl. 4. f. 16. *Idioptera*, Meq. Species 1–3.
- d d.* One veinlet between the subanal vein and the third externo-medial.
- e.* Radial vein united by a veinlet to the subcostal at its fork.—Meig. Zw. i. 125. Div. E. pl. 6. f. 2. *Limnophila* p., Meq. Species 4.
- e e.* Radial vein united to the subcostal at some distance beyond its fork.
- f.* Petiole of the first externo-medial vein a little shorter than its fork.—*Limnophila* p., Meq. Species 5, 6.
- f f.* Petiole of the first externo-medial vein as long as its fork.—Meig. Zw. i. 127. Div. G. pl. 4. f. 20. *Limnophila* p., Meq. Species 7–12.
- f f f.* Petiole of the first externo-medial vein longer than its fork.
- g.* Petiole of the first externo-medial not twice the length of its fork.—Meig. Zw. i. 122. Div. D. pl. 4. f. 15. *Limnophila* p., Meq. Species 13–15.
- g g.* Petiole of the first externo-medial vein twice the length of its fork.—*Limnophila* p., Meq. Species 16.
- g g g.* Petiole of the first externo-medial vein more than twice the length of its fork.—*Limnophila* p., Meq. Species 17.
- g g g g.* Petiole of the first externo-medial vein about six times the length of its fork.—Meig. Zw. i. 126. Div. F. pl. 6. f. 3.—*Limnophila* p., Meq. Species 18.

## SECTION 2.

Antennæ of the male shorter than the thorax. Wings dilated, and almost angular on the hind border; mediastinal vein ending rather before two-thirds of the length of the wing, joined to the subcostal by a veinlet very near its tip; subcostal ending at about four-fifths of the length; radial and eubital springing from a common petiole, which they rather exceed in length, and which proceeds from the subcostal at some distance before half the length of the wing; radial forked before one-fourth of its length; eubital joined near its base to the third externo-medial by a veinlet, whose angle emits the first externo-medial; the latter is forked at half its length, and is connected with the third externo-medial by a veinlet whose angle emits the second externo-medial; third externo-medial connected with the subanal by two veinlets, one at a little before half the length of the wing, the other opposite the middle of the discal areolet; axillary vein undulating; discal areolet pentagonal, hardly twice longer than broad.

3. **marmorata**, Hoffm.; Meig. Zw. i. 121. 5.; Zett.; Gimm.; Schumm.; Stæg.; Ros. (V.)—*maculata*, Meig. Klass.—Var. *decora*, Hal. Cinerea, thorace quadrivittato, alis albidis, guttis plurimis einebris aut fuscescentibus maeulisque costalibus subquadris obsecurioribus, abdome fasciis albidis, pedibus testaceis, femoribus apiee fusis. Long. 3-4; alar. 8-10 lin.

Cinereous. Palpi and antennæ black. Thorax with four brown stripes; metathorax and peetus hoary. Wings whitish, with numerous grey or brownish dots along the veins, and with some darker subquadrate spots along the costa. Halteres whitish, with brown tips. Abdomen with a whitish band on each segment. Legs testaceous; tips of the femora brown.

Not common. (E. S. I.)

## SECTION 3.

*d d.* One veinlet between the subanal and the third externo-medial.

*e.* Radial vein united to the subcostal at its fork.

Mediastinal vein ending at a little before three-fourths of the length of the wing; subcostal ending at a little beyond the mediastinal; radial and eubital springing from a common petiole, which exceeds them in length, and which proceeds from the subcostal at much before half the length of the wing; radial forked before one-third of its length; its fore fork connected near the base by a transverse veinlet with the subcostal; eubital forming an angle near its base, and there connected with the third externo-medial by an oblique transverse veinlet, whose angle emits the first externo-medial; the latter is forked beyond half its length and is connected with the third externo-medial by a transverse veinlet, whose angle emits the second externo-medial; subanal curved abruptly to the hind border, connected with the third externo-medial

by a veinlet which is nearly opposite the middle of the discal areolet; discal areolet pentagonal, long and narrow.

4. **discicollis**, Meg. ; Meig. Z. i. 125. 13 (1818) ; Meq. ; Zett. ; Schumm. ; Stæg. ; Ros. (V.)—Var. *placida*, Walk. Fulva, capite supra palpis antennisque nigris, thorace vittis tribus fuseis, alis subluridis, abdominis dorso pedibusque fuscis. Long. 5 ; alar. 10 lin.

Tawny. Head black above. Palpi and antennæ black, tawny at the base. Thorax with three brown stripes, which are almost confluent. Metathorax greyish-black. Wings slightly lurid; veins black, testaceous towards the base; stigma brown. Halteres testaceous. Abdomen brown above; tip tawny; underside brown towards the tip. Legs brown, pubescent; coxae tawny.

Not rare. Inhabits woods. (E.)

#### SECTION 4.

*e e.* Radial vein united to the subcostal at some distance beyond its fork.

*f.* Petiole of the first externo-medial a little shorter than its fork.

Veins pilose towards the tips; mediastinal vein ending at about two-thirds of the length of the wing, joined to the subcostal by a little veinlet close to its tip; subcostal ending at about five-sixths of the length; radial and cubital springing from a common petiole, which is nearly half their length, and which proceeds from the subcostal at a little beyond half the length of the wing; radial forked before one-third of its length; cubital joined to the third externo-medial by a transverse veinlet, whose middle emits the first externo-medial; first externo-medial forked before half its length, joined at some distance before its fork with the third externo-medial by a transverse veinlet, whose middle emits the second externo-medial; third externo-medial joined with the subanal by a veinlet which is opposite the middle of the long and almost tetragonal discal areolet.

5. **lucorum**, Meig. Z. i. 125. 12 (1818) ; Meq. ; Gimm. ; Stæg. ; Ros. (V.) ; Zett.—*aberrans*, Walk. *Cana*, palpis antennisque nigris, thorace vittis quatuor fuscis, alis subcinereis, venulis transversis fusco sublimbatis, abdomine fuso, pedibus testaceis, femoribus tibiis tarsisque apice fuseis. Long. 4-6 ; alar. 8-12 lin.

Hoary. Palpi and antennæ black, the latter sometimes testaceous at the base. Thorax with four brown stripes, the outer pair short. Wings very slightly greyish; transverse veinlets slightly clouded with brown; stigma indistinct. Halteres white, with brown knobs. Abdomen brown, testaceous at the tip. Legs testaceous; tarsi towards the tips, and tips of the femora and of the tibiae, brown.

Common. Inhabits woods. (E. S. I.)

6. **tempestiva**, Walk. C. D. B. M. i. 53 (1848). *Fulva*, antennis nigris, thoracis disco fusco, alis limpidis, tarsis fuseis. Long. 4 ; alar. 9 lin.

two-thirds of its length, and is connected with the third externo-medial by two transverse veinlets; the outer one of these forms an angle, whence proceeds the second externo-medial; third externo-medial connected with the subanal by an oblique transverse veinlet, which is beyond the middle of the hexagonal discal aroolet.—*Limnophila* p., Mcq.

#### SUBSECTION 1.

*Solitary species, with spotted wings and slender legs. Inhabit the banks of streams and of ponds.*

13. **punctata**, Meig. Zw. i. 122. 6 (1818); Mcq.; Gimm.; Schumm.; Stæg.; Ros. (V.); Zett.—*ocellaris*? L.; F.; Schr.; Gmel. —Var. *geniculata*, Hoffm.; Meig.; Gimm. Cana, palpis antenuisque nigris, thorace vittis tribus cinercis, alis subalbidis guttis plurimis fusca maculisque nonnullis obscurioribus, pedibus nigris, femoribus tibiisque basi pallidis. Long. 5; alar. 12 lin.

Hoary. Palpi and antennæ black. Thorax with three grey stripes. Wings dingy whitish, with many brown dots, and three or four darker brown spots, one at the tip of the axillary vein, the rest along the hind side of the subcostal vein; a row of small, dark brown, subquadrate spots between the subcostal vein and the costa; these extend from near the base to beyond the middle, where they are succeeded by three larger and more remote spots; vein black, testaceous at the base. Halteres whitish. Legs black, pubescent; tibiæ ferruginous towards the base; femora tawny, black towards the tips.

Not rare. (E. S. I.) Var.  $\alpha$  much resembles var.  $\beta$  *geniculata*, but may be distinguished by its darker colour, the darker and more numerous spots of its wings, and especially by the greater length of the fork of the first externo-medial vein.

#### SUBSECTION 2.

*Gregarious species, with ocellated wings and stout legs. Inhabit woods; their flight vertical, rising and falling.*

14. **picta**, F. E. S. Suppl. 550. 80 (1805); Latr.; Lam.; Meig.; Mcq.; Schumm.; Zett.; Gim.; Stæg.—*ocellaris*, Schr.; Curt. ! B. E. 50; Guér.; Gimm. Cinerea, thorace antice fulvo, alis limpidis maculis ocellisque cinereis, abdomine lurido aut fusco, vittis tribus nigris, pedibus testaceis, femoribus nigro-cinctis. Long. 4–5; alar. 9–10 lin.

Grey. Head behind and thorax in front tawny. Proboscis and palpi black. Antennæ brown, testaceous towards the base, which is black. Wings limpid, more or less mottled with grey, and with three more or less complete grey ocelli. Halteres testaceous; knobs blackish at the base. Abdomen lurid or brownish, with three black dorsal stripes; hind borders of the segments whitish. Legs testaceous, pubescent; femora with one or two black bands; tarsi darker than the tibiæ.

Common. (E. S. I.)

## SUBSECTION 3.

*Species with short antennæ, unspotted wings, and stout legs.*

15. **unicolor**, n. Lutea, capite cano, palpis antennisque nigris, alis subcinereis ad costam subtestaceis, tibiis et tarsorum articulis apice nigris. Long. 4; alar. 10 lin.

Luteous. Head hoary. Palpi and antennæ black, the latter tawny towards the base. Wings pale greyish, with a slight testaceous tinge, which is most apparent by the costa; stigma and halteres testaceous; tips of the tibiæ and of the joints of the tarsi black.

Rare. (E.)

## SECTION 7.

*g g.* Petiole of the first externo-medial vein twice the length of its fork.

Mediastinal vein ending at rather before two-thirds of the length of the wing, forked at its tip; subcostal joining the costal at beyond three-fourths of the length, joined very near its tip with the radial by a transverse veinlet; radial and cubital springing from a common petiole, which proceeds from the subcostal at beyond half the length of the wing; radial forked near its base; cubital forming very near its base an angle, whence proceeds the first externo-medial; the latter is also rectangular near its base, and is forked at a little before two-thirds of its length, and is connected with the third externo-medial by two veinlets; the outer one of these forms a slight angle, whence proceeds the second externo-medial; third externo-medial connected with the subanal by a transverse veinlet, which is at one-third of the length of the discal arcolet.

16. **tarda**, Walk. C. D. B. M. i. 41 (1848). Cinerea, antennis pedibusque nigris, thoracis lateribus canis, alis cinereis, venis transversis nebulosis, femoribus basi coxisque fulvis. Long. 3; alar. 7 lin.

Grey. Antennæ black, much longer than the thorax. Thorax hoary on each side. Wings grey; transverse veinlets clouded with darker grey; stigma dark grey; veins black. Halteres tawny, with brown knobs. Legs black; femora towards the base and coxae tawny.

Not common. (E.)

## SECTION 8.

*g g g.* Petiole of the first externo-medial vein more than twice the length of its fork.

Mediastinal vein ending at a little beyond two-thirds of the length of the wing, connected with the subcostal by a veinlet near its tip; subcostal ending at about five-sixths of the length; radial and cubital springing from a common petiole, which they nearly equal in length, and which proceeds from the subcostal at some distance before half the length of the wing; radial forked before one-sixth of its length; cubital forming very near its base an angle, and then connected with the

*legs, ferruginous. Wings brown; veins black, ferruginous at the base. Male. Legs and sides of the abdomen very hairy. Fem. Hind tibiæ and sides of the abdomen slightly hairy, often bare.*

Not common. Inhabits the banks of ponds. (E.)

21. **vagans**, Walk. C. D. B. M. i. 43 (1848). *Fœm. cinerea, antennis nigris, pectore abdomineque sordide fulvis, alis subcinereis, stigmate fusco, pedibus fulvescentibus, femoribus tibiisque apice tarsisque fuscis. Long. 2½; alar. 6 lin.*

*Fem. Slender, greyish. Antennæ black, a little longer than the head, tawny at the base. Pectus, abdomen, and legs dingy tawny. Wings slightly greyish; stigma and veins brown. Halteres pale, with darker knobs. Tarsi and tips of the femora and of the tibiæ brown.*

Not common. (E.)

#### SUBSECTION 2.

Mediastinal vein ending at a little beyond two-thirds of the length of the wing; subcostal ending at about five-sixths of the length, connected by a transverse veinlet near its tip with the radial; radial and cubital springing from a common petiole, which they rather exceed in length, and which proceeds from the subcostal at a little before the middle of the length of the wing, and is almost angular near its base; radial forked near its base; cubital connected by a transverse veinlet at its base with the first externo-medial; first externo-medial springing from the third, with which it is also connected by a transverse veinlet, whose angle is the origin of the second externo-medial; subanal connected with the third externo-medial by a transverse veinlet, which is very little beyond the base of the first externo-medial.

22. **errans**, Walk. C. D. B. M. i. 55 (1848).—var. *remota*, Walk.—var. *ignota*, Walk. *Fœm. lutea aut fulva, antennis apiee obscurioribus, thorace nonnunquam vitta einerea, alis limpidis, abdominis dorso fulvo, pedibus flavis, femoribus tibiisque apiee tarsisque fuscis. Long. 3–4; alar. 7–10 lin.*

*Fem. Luteous or tawny. Antennæ tawny, darker towards the tips, longer than the head. Thorax with an occasional greyish stripe. Wings limpid; veins brown, tawny towards the base. Abdomen above tawny. Legs yellow; tarsi and tips of the femora and of the tibiæ brown.*

Not common. (E.)

#### SECTION 12.

*e c. Radial vein not forked.*

*d. Veinlet between the subanal and the third externo-medial in a line with the inner side of the discal areolet, or nearer to the base of the wing.*

*e. Subcostal vein ending where it joins the radial.*

Large bright-coloured species, with more or less variegated wings.

Mediastinal vein ending beyond two-thirds of the length, connected by a veinlet very near its tip with the subcostal; subcostal ending at

about five-sixths of the length, connected by a veinlet at its tip with the radial; radial and cubital springing from a common petiole, which they much exceed in length, and which proceeds from the subcostal at a little before half the length of the wing, and forms an angle near its base; cubital connected near its base with the third externo-medial by a veinlet which emits the first externo-medial; the latter is connected with the third externo-medial by a veinlet whose angle emits the second externo-medial; subanal connected with the third externo-medial by a veinlet in a line with the inner end of the pentagonal discal areolet.

#### SUBSECTION 1.

*First externo-medial vein emitted from near the fore end of the veinlet; discal areolet threee longer than broad.*

23. **xanthoptera**, Meig. Zw. i. 141. 46 (1818); Meq.; Stain.; Gimm.; Schumm.; Stæg.; Ross. (V.); Zett. Lutea, antennis apice palpisque nigris, thorace vittis duabus discalibus maculisque duabus lateralibus nigricantibus, alis luteis, venuis transversis cinereo-limbatis, pedibus testaceis, femoribus tarsisque apice fuseis. Long. 5–6; alar. 10–12 lin.

Luteous. Palpi black. Antennæ tawny, black towards the tips. Thorax with two blackish stripes and a blackish spot on each side. Wings luteous; transverse veinlets clouded with grey. Halteres testaceous, with brownish knobs. Legs testaceous; tips of the femora and of the tarsi brown.

Not very common. (E.)

#### SUBSECTION 2.

*First externo-medial vein emitted from the middle of the veinlet; discal areolet little more than twice longer than broad.*

24. **maculata**, L. F. S. 1736 (1761); F.; Gmel.; Meig.; Schumm.; Gimm.; Zett.—*quadrinotata*? Meig.; Gimm.; Zett. Lutea, capite supra fusco, palpis antennisque nigris, thorace vittis tribus nigris, alis sub-cinereis nebulosis, maculis costalibus fuseis, abdomine fasciis abbreviatis nigro-cinereis, pedibus fulvis, femoribus tibiisque apice tarsisque nigris. Long. 5–6; alar. 10–12 lin.

Luteous. Head brown above. Palpi and antennæ black, the latter tawny towards the base. Thorax black in front, and with four black stripes, the outer pair short. Wings greyish, indistinctly mottled, and with seven brown spots along the costa. Halteres testaceous, with brown knobs. Abdomen with a transverse greyish-black spot on each segment. Legs tawny, pubescent; femora and tibiæ with black tips; tarsi black, except towards the base.

Not rare. (E.)

#### SECTION 13.

Mediastinal vein ending at a little before two-thirds of the length of the wing; subcostal ending at before five-sixths of the length, con-

*cinereis*, pedibus testaceis, femoribus apiee tarsisque nigris. Long. 4-5; alar. 9-10 lin.

Blaek. Pectus and abdomen beneath dingy testaceous. *Wings grey, with whitish spots; three darker grey spots on the costa.* Halteres testaceous; knobs brown. Legs testaceous, pubescent; tarsi and tips of the femora blaek.

Common. (E. S. I.)

31. **analis**, Meig. Zw. i. 141. 45 (1818).—*flavipes*, Meig. Klass. Nigra, pectore et metathorace eanis, *alis albidis, cinereo-subnebulosis, maculis costalibus fuscis, venulis transversis fusco-limbatis.* Long. 4; alar. 9 lin.

Black, shining. Pectus and metathorax hoary. *Wings whitish, slightly mottled with grey; a row of brown spots along the costa; transverse veinlets clouded with brown.* Halteres pale testaceous, with brownish knobs.

Not common. (E.)

#### SECTION 15.

*d d.* Veinlet between the subanal and the third externo-medial very nearly opposite the inner end of the diseal areolet.

Mediastinal vein ending at before two-thirds of the length of the wing; subcostal ending at three-fourths of the length, connected with the radial by a transverse veinlet close to its tip; radial and eubital springing from a common petiole, which proceeds from the subcostal at beyond half the length of the wing; first externo-medial proceeding from near the base of the eubital, connected by two transverse veinlets with the third externo-medial; second externo-medial proceeding from the angle of the outer of these veinlets, and in a line with the inner one another veinlet connects the third externo-medial with the subanal.

32. **Morio**, F. E. S. iv. 242. 40 (1792); Gmel.; Mcig.; Stæg.; Zett. D. S.—*leucocephala*, Meig.; Mcq.; Schumm.; Ross. (V.)—*angustipennis*, Zett. I. L. *Nigra, nitens, capite supra thoracisque vittis lateralibus argenteis, alis cinereis, stigmate nigro, femoribus testaccis, apiee nigris.* Long.  $2\frac{1}{2}$ -3; alar. 6 lin.

Black. Body shining. Head silvery-white above. Thorax with a silvery-white stripe on each side. *Wings grey; stigma black.* Halteres pale testaceous, with brownish knobs. Femora testaceous, with blaekish tips.

Common. (E. S. I.)

33. **didyma**, Meig. Zw. i. 135. 35 (1818); Mcq.; Schumm.; Stæg.; Ross. (V.); Zett. Cinerea, capite palpis antemisque nigris, pectore et metathorace canis, *alis albido-limpidis, maculis duabus costalibus fuscis, apicibus venulisque transversis fusco-sublimbatis, pedibus testaceis, femoribus tibiisque apice tarsisque fuscis.* Long. 3-4; alar. 6-8 lin.

Cinereous. Head, palpi, and antennæ black. Proboscis cinereous. Pectus and metathorax hoary. *Wings limpid, whitish, with two brown spots along the costa, slightly clouded with brown at the tips and on the transverse veinlets.* Halteres pale testaceous, with darker knobs. Abdomen testaceous at the tip. Legs testaceous; tarsi, except at the base, and tips of the femora and of the tibiae, black. *Male.* Femora with an antecapital blackish band.

Common. (E. S. I.)

34. **dumetorum**, Meig. Zw. i. 136. 36 (1818); Mcq.; Schumm.; Stæg.; Ross. (V.); Zett. Fulva, capite palpis antennisque nigris, fronte argentea, thorace vittis tribus fuscis, *alis subcinereis, maculis tribus costalibus apicibusque fuscis, venis transversis fusco-limbatis, abdomine fasciis fuseis, pedibus testaccis, tarsis apice fuscis.* Long. 3; alar. 6 lin.

Tawny. Head, palpi, and antennæ black. Front silvery-white. Thorax with three brown stripes; lateral pair very short; a ferruginous stripe on each side. Pectus testaceous. *Wings slightly greyish, pale brown at the tips, and with three darker brown spots on the costa, one at half the length of the wing, the other at three-fourths of the length; transverse veinlets clouded with brown.* Halteres whitish, with brown tips. Abdomen with a broad brown band along the hind border of each segment. Legs testaceous; tarsi brownish towards the tips.

Not rare. (E.)

35. **chorea**, Wied.; Meig. Zw. i. 134. 43 (1818); Mcq.; Schumm.; Stæg.; Ross. (V.); Zett. Testacea, vertice palpis antennisque nigris, thorace vitta lata cinerea, *alis sublimpidis, venis nonnullis fusco-limbatis, femoribus tibiisque apice tarsisque nigris.* Long. 3; alar. 7 lin.

Testaceous. Vertex of the head black. Palpi and antennæ black, testaceous towards the base. Thorax with a broad grey stripe. *Wings nearly limpid; veins testaceous, black and slightly clouded with brown towards the tips; stigma pale brown.* Halteres pale testaceous. Legs slender; tarsi and tips of the femora and of the tibiae black.

Generally distributed. (E. S. I.)

36. **lutea**, Meig. Zw. i. 133. 31 (1818); Mcq.; Gimm. *Testacea, palpis antennisque nigris, alis sublimpidis, femoribus apice tarsisque sordide testaccis aut fuscis.* Long. 3; alar. 7 lin.

*Pale testaceous.* Palpi and antennæ black, the latter testaceous at the base. *Wings nearly limpid; veins testaceous; stigma testaceous, or very pale brown.* Knobs of the halteres, tarsi, and tips of the femora dingy testaceous or brown.—Var.  $\beta$ . Stigma obsolete. Abdomen with an indistinct brownish dorsal stripe.

Generally distributed. (E. S. I.)

37. **modesta**, Wied.; Meig. Zw. i. 134. 32 (1818); Mcq.; Zett.; Gimm.; Schumm.; Stæg.; Ross. (V.) *Testacea, capite cano, palpis antennisque nigris, thorace vitta fusca, alis limpidis, abdomine vitta nigra, femoribus tibiisque apice tarsisque fuscis.* Long. 3-4; alar. 7-8 lin.

## SECTION 17

Mediastinal vein ending at very much before two-thirds of the length of the wing; subcostal ending at about four-fifths of the length; radial and cubital springing from a common petiole, which proceeds from the subcostal at about half the length of the wing, and which they much exceed in length; radial forked at half its length; its fore fork very short; cubital joined very near its base with the third externo-medial, by a transverse veinlet, whose extremely obtuse angle near its hind end emits the first externo-medial; the latter is connected with the third externo-medial by a veinlet, whose middle, which is hardly angular, emits the second externo-medial; subanal connected with the third externo-medial by an oblique veinlet which is opposite one-fourth of the length of the discal areolet.

44. **tenella**, Meig. Zw. i. 146. 54 (1818); Mcq.; Gimm. Cana, palpis antennisque nigris, thorace antico pectore et metathorace albidis, alis vix subcincreis, venis stigmateque pallidis, halteribus albidis apice fuscescentibus, abdomine fuscescente, pedibus testaceis, tarsis fuscis. Long.  $3\frac{1}{2}$ ; alar. 8 lin.

Hoary. Palpi and antennæ black; front of the thorax, pectus, and metathorax whitish. Wings very slightly greyish; veins and stigma pale. Halteres whitish, with pale brownish tips. Abdomen brownish. Legs testaceous; tarsi brown.

Not common. (E.)

*e e.* No veinlet between the radial vein and the costa.

## SECTION 18.

Mediastinal vein ending in a transverse veinlet at a little beyond two-thirds of the length of the wing; subcostal curved abruptly to the hind border at rather beyond five-sixths of the length; radial and cubital much longer than their common petiole, which proceeds from the subcostal at some space before two-thirds of the length of the wing; first externo-medial proceeding from the cubital at a little before one-third of its length, angular near its base, joined to the third externo-medial by two veinlets; second externo-medial springing from the middle of the outer veinlet; subanal connected to the third externo-medial by an oblique veinlet, which is nearer than the inner of the two before mentioned to the base of the wing.

45. **turpis**, n. Nigro-fusca, nitens, palpis antennisque nigris, thorace vittis duabus fulvis, pectore ferrugineo, alis subcinereis, abdomine fuso, pedibus testaceis, femoribus tibiisque apice tarsisque fuscis. Long.  $3\frac{1}{2}$ -4; alar.  $7-7\frac{1}{2}$  lin.

Blackish-brown, shining. Palpi and antennæ black. Thorax with a short tawny stripe on each side in front. Pectus ferruginous, testaceous by the base of each wing. Wings greyish; stigma brown; veins

black. Abdomen brown. Legs dark testaceous; tarsi and tips of the femora and of the tibiae brown.

Rare. In the British Museum. (E.)

*a a.* No discal areolet.

*b.* Third externo-medial vein forked.

*c.* Radial vein joined by two veinlets to the subcostal.

### SECTION 19.

Mediastinal vein ending beyond three-fourths of the length of the wing, united at its tip to the subcostal by a little veinlet, which is occasionally wanting; subcostal ending beyond five-sixths of the length, united to the fore branch of the radial by two veinlets, which enclose the stigma; radial and cubital springing from a common petiole, which is less than half their length, and which proceeds from the subcostal at a little before two-thirds of the length; radial forked very near its base; cubital forming close to its base an angle, and then joined to the third externo-medial by a transverse veinlet, which emits the first and second externo-medial, the latter is forked very near its tip; third externo-medial forked at some little distance from its tip, joined to the subanal by a veinlet, which is nearer than the veinlet in front of it to the tip of the wing.

46. **finitima**, Walk. C. D. B. M. i. 52 (1848); cinereo-fusca, antennis nigris, thorace vittis quatuor fulvis, alis subfuscis, abdominis suturis pallidioribus, pedibus fulvis, femoribus tibiisque apice tarsisque fuscis. Long. 3-4; alar. 8-10 lin.

Greyish-brown. Antennae black, about twice the length of the head. Thorax with four tawny stripes. Wings slightly brownish; stigma brown; veins dark brown. Halteres pale yellow, with brown knobs; hind borders of the abdominal segments paler. Legs dark tawny; tarsi and tips of the femora and of the tibiae brown.

Not common. (E.)

*c c.* Radial vein joined by one veinlet to the subcostal.

*d.* Cubital vein forked.

### SECTION 20.

Mediastinal vein ending at about three-fourths of the length of the wing; subcostal ending at half the distance between the mediastinal and the tip of the wing, connected with the radial by a transverse veinlet near its tip; radial and cubital springing from a common petiole, which proceeds from the subcostal at much beyond half the length of the wing; cubital forked at one-third of its length; first and second externo-medial springing from a common petiole, which is full twice their length, proceeds from the third externo-medial, and is connected by a transverse veinlet near its base with the base of the cubital; third externo-medial forked near its tip, connected with the subanal by an

petiole of the first externo-median vein is about as long as its branches.\* Halteres pale yellowish; narrow hind edge of the abdominal segments lighter grey; vagina and valves shining-ferruginous, the latter very little curved upwards and acuminate at the tips; coxae ferruginous-eine-raseent; femora ferruginous, the tip dusky; tibiæ fuseo-ferruginous, darker at the tips; tarsi fuseous.—Very closely allied to some species from the Arctic regions of North America.”—*Hal. MSS.*

Rare. (E.)

*c c.* Axillary vein not curved abruptly to the hind border.

#### SECTION 24.

51. ***lateralis***, Meq. H. N. D. ii. 653. 8 (1835); Meig.—*flavo-limbata*, Hal.—*manifesta*, Walk. *Atra, nitens*, mesothorace et scutello flavo-marginatis, pleuris flavo-maculatis, alis obseure hyalinis, halteribus pallide fusca, abdominis lateribus flavo-lineatis, pedibus nigriantibus. Long.  $2\frac{1}{2}$ ; alar.  $5\frac{1}{2}$  lin.

“Glossy black (or black-brown). Antennæ blackish, sixteen-jointed. Mesonotum and scutellum edged, pleuræ spotted with clear light yellow. Wings obseure hyaline; a very pale stigmatic cloud behind the apex of the subcostal vein; veins fuscous, pubescent, very finely towards the tip, also the præfurea (common petiole of the radial and cubital veins); membrane glabrous; fork of the radial vein short, unconnected with the subcostal; anterior branch shorter than its petiole; branches of the first externo-medial vein longer than its petiole; axillary vein not sinuated, diverging widely from the anal, ending about half-way between the anal angle and the end of the anal vein; mediastinal vein ending nearly opposite the first fourth or third of the anterior radial areolet, and connected with the subcostal a little before this; no discal areolet; brachial nearly conterminous (Div. A, Meig.). Halteres pale brown. Abdomen with a narrow yellow lateral line; last segment above and beneath with a narrow yellow edge behind. Legs nearly black, rather slender, finely pubescent; middle pair a little shorter than the rest. *Male.* Antennæ as long as the thorax. Forceps longer than the adjoining segment; outer arms with the first part thick, blackish; second one-half thinner, piceous, linear, truncated; inner appendages slender, palpiform. *Fem.* Antennæ a little shorter than the thorax. Tentacles slender, pointed, gently turned up, brown.—This species differs much in the veining of the wings from the true *Eriopteræ*, and especially in the disposition of the radial forked vein.”—*Hal. MSS.*

Not common. (E. I.)

The spot on the middle of the anterior radial areolet is sometimes half connected with the transverse one on the end of the discal areolet, by an intermedial dot on the cubital vein forming a second (but interrupted) half band, so that the marking of the wings may be described (beginning from the base) as two large anterior spots, two abbreviated sinuous transverse bands, the outer one interrupted, two small spots, one on the fork of the first externo-medial vein, one on the tip of the first radial branch.

52. **filata**, n. Cana, gracillima, palpis antennisque nigris, alis subcinereis perangustis, abdomine nigro-cinereo, pedibus nigris, femoribus basi fulvis. Long. 3; alar. 6 lin.

Hoary, very slender. Palpi and antennæ black. Wings greyish, very narrow; veins black, testaceous at the base; stigma obsolete. Halteres testaceous. Abdomen long, blackish-grey. Legs black; femora tawny at the base.

Not common. (E.)

### SECTION 25.

Mediastinal vein ending at a little beyond two-thirds of the length of the wing; radial ending at beyond three-fourths of the length; radial and cubital springing from a common petiole, which they exceed in length, and which proceeds from the subcostal at somewhat beyond two-thirds of the length of the wing; radial forked at one-fourth of its length, connected by a veinlet at its fork with the subcostal; cubital connected near its base with the third externo-medial by a veinlet, which is opposite the veinlet which connects the third externo-medial with the subanal, and whose angle emits a vein, which is the common petiole of the first and second externo-medial; the two latter being about twice the length of their petiole.—Resembles the *Eriopteræ*.

53. **diurna**, Walk. C. D. B. M. i. 54 (1848).—Var. *apparens*, Walk. *Fem.* nigro-cinerea, antennis basi thoracisque lateribus testaceis, alis subcinereis, stigmate fuscescente, venis nigris basi testaceis, halteribus abdominalis apice pedibusque testaceis. Long. 3-3½; alar. 6-7 lin.

*Fem.* Blackish-grey. Antennæ longer than the head, testaceous at the base. Sides of the thorax and tip of the abdomen testaceous. Wings slightly greyish; stigma pale brown; veins black, testaceous at the base. Halteres and legs testaceous, the latter slender.

Not common. (E.)

---

### Genus VI. **DICRANOTA.**

DICRANOTA, Zett. Dipt. Scand. x. 4033 (1851). *Limnobia* p., Schumm.; Hal.; Zett. I. L.

Corpus elongatum, angustum, sublineare. Caput parvum, rotundatum. Oculi laterales, rotundi. Rostrum breve. Proboscis non elongata. Palpi exserti, cylindrici, incurvi, 4-articulati, articulus subæqualibus. Antennæ 13-articulatæ, subfiliformes; articulus primus breviusculus, cylindricus; secundus brevior, cyathiformis. Abdomen lineare. Pedes elongati, graciles, nudi; tibiæ calcaribus exiguis. *Mas.* Antennæ thorace paullo longiores; articuli ovales. Abdomen depresso; anus parvus, obtusus, parum subclavatus. *Fem.* Antennæ thorace paullo breviores; articuli rotundati. Abdomen subcylindricum; anus sat acutus, stylis duobus subulatis, leviter recurvis.

fore the middle of the length of the wing, and is almost angular near its base; radial forked near its base; cubital connected by a transverse veinlet at its base with the first externo-medial, the latter springing from the third externo-medial, with which it is also connected by a transverse veinlet, whose angle is the origin of the second extero-medial; subanal connected with the third externo-medial by a veinlet, which is very little beyond the base of the first externo-medial. Abdomen long, pilose, with eight segments. Legs slender, rather long, unarmed; coxae short; hind tibiæ with minute apical spurs. *Fem.* Wings broad.

**I. pilosa**, Schumm. Dipt. Siles. 149. 34. pl. 2. f. 7 (1829); Zett.—*macroptera*, Meq.; Stæg.; Zett.; Perris.—*mollissima*, Hal. Cinereoluminescens, capite cinereo, palpis antennisque nigris, his basi ferrugineis, thorace vittis tribus obscuris intermedia gemina, alis cinereo-flavescens-tibus pilosis, stigmate parum distincto, abdomine fuscescente piloso, ano ferrugineo, pedibus ferrugineo-flavis, femoribus tibiisque apice tarsisque fuscis; *Fem.* alis latis. Long. 2–3; alar. 6 lin.

Greyish-lutescent. Head grey. Palpi and antennæ black, the latter ferruginous at the base. Thorax with three dark stripes, the middle one double. Wings greyish-yellow, pilose; stigma indistinct. Halteres dingy white; club pale brown. Abdomen brown, hairy. Legs ferruginous-yellow; tarsi and tips of the femora and of the tibiæ brown. *Fem.* Wings very broad.

The larva has been found in an *Agaricus*. Rare. In Mr. Haliday's collection. (I.)

---

### Genus VIII. RHAMPHIDIA.

**RHAMPHIDIA**, Meig. Zw. vi. 282 (1830); Meq.; Stæg.; Ross. (V.); Zett. *Limnobia* p., Meig. Zw. i.; Schumm. *Megarhina*, St. Farg. *Rhamphidia* et *Leptorrhina*, Steph.

Corpus medioere, elongatum, cylindricum, subpubescens. Caput parvum, rotundatum, postice leviter attenuatum. Oculi rotundi, remoti. Proboscis angusta, recta, cylindrica, capite duplo longius. Palpi 4-articulati, incurvi; articuli primus, secundus, et tertius oblongi; quartus paullo longior et angustior. Antennæ 16-articulatae, breves, simplices, pilosæ, extrorsum subsetaceæ; articulus primus modice longus, cylindricus; secundus cyathiformis; tertius et sequentes globosi. Thorax ellipticus. Scutellum parvum. Alæ modice angustæ, incumbentes, parallelæ, nudæ. Abdomen elongatum, segmentis octo. Pedes longi, graciles, subnudi, inermes; coxae breves; tibiæ calcaribus brevissimis. *Mas.* Anus parvus, forcipe inflexa. *Fem.* Anus stylis duobus elongatis, subulatis, subrectis.

Body long, cylindrical, slightly pubescent, of moderate size. Head small, nearly round, slightly attenuated hindward. Eyes round, re-

mote. Proboscis slender, straight, cylindrieal, twiee the length of the head. Palpi four-jointed, inflexed; first, second, and third joints oblong; fourth a little longer and more slender. Antennæ sixteen-jointed, short, simple, pilose, subsetaceous towards the tips; first joint cylindrieal, moderately long; second eyathiform; third and following globose. Thorax elliptical. Scutellum small. Wings ineumbent, parallel, bare, rather narrow; mediastinal vein ending at before two-thirds of the length of the wing; subcostal ending at three-fourths of the length, connected with the radial by a transverse veinlet close to its tip; radial and cubital springing from a common petiole, which proceeds from the subcostal at beyond half the length of the wing; first externo-medial proceeding from near the base of the cubital, connected by two transverse veinlets with the third externo-medial; second externo-medial proceeding from the angle of the outer one of these veinlets; and in a line with the inner one another veinlet connects the third externo-medial with the subanal. Abdomen long, with eight segments. Legs long, slender, nearly bare, unarmed; coxae short; tibiae with very short spurs. *Male.* Anus small, with an inflexed pair of forceps. *Fem.* Anus with two long subulate, nearly straight styles.

With the exception of the long proboscis, this genus hardly differs from *Limnobia*, Div. N., Meigen.

1. **longirostris**, Meig. Zw. i. 146. 53 (1818); Meig.; Schumm.; Stæg.; Ross. (V.); Zett. *Testacea*, capite nigro, thorace vittis tribus fuscis, alis sublimpidis, abdomine supra fuseo, femoribus tibiisque apice tarsisque nigrieantibus. Long. 4; alar. 8 lin.

*Testaceous.* Head, palpi, and antennæ black. *Thorax with three brown stripes.* Wings nearly limpid; veins brown, testaceous at the base; stigma indistinct, very pale brown. Halteres whitish, with brown knobs. Abdomen brown, testaceous at the tip, and mostly so beneath. Legs dark testaceous; tarsi and tips of the femora and of the tibiae blackish.

Rare. In the British Museum, and in Mr. Håliday's collection. (E. I.)

2. **flava**, Steph. MSS. *Lutea*, capite nigro, proboscide graeillimo, alis limpidis angustis, pedibus testaceis, femoribus tibiisque apice tarisque fuseis. Long. 4; alar. 7 lin.

*Luteous*, very slender, testaceous beneath. Head, palpi, and antennæ black. Proboscis very slender, nearly twice the length of the head. Wings limpid, narrow; veins brownish, testaceous towards the base. Halteres pale testaceous. Abdomen pale testaceous at the tip. Legs testaceous, long, slender; tarsi and tips of the femora and of the tibiae brown.

Rare. In the British Museum. (E.)

---

pubescent valves. *Fem.* Antennæ simple, pilose, a little shorter than the thorax. Abdomen lanceolate, with two subulate, rather short, slightly recurved styles.

1. **maculata**, Meig. Zw. i. 153. 1 (1818); Mcq.; Stæg.; Zett. Nigra, thorace vittis duabus dorsalibus lateribusque testaceis, alis limpidis guttis cinereis maculisque nonnullis costalibus obscurioribus, abdome piceo, pedibus testaceis, femoribus tibiis tarsisque apice nigris. Long. 3-4; alar. 7-8 lin.

Black. Thorax mostly hoary, and with two hoary dorsal stripes on each side. Wings limpid, with numerous grey dots, and with four or five darker grey spots along the costa, which has a slight testaceous tinge. Halteres testaceous. Abdomen piceous, with large silvery-white spots along each side, tip tawny. Legs testaceous; tarsi towards the tips, and tips of the femora and of the tibiæ, black.

Generally distributed; is very partial to the Lime-tree. (E.S.I.)

#### Genus XI. CYLINDROTOMA.

**CYLINDROTOMA**, Mcq.; Stæg.; Ross. (V.); Loew; Zett. *Limnobia* p., Meig.; Schumm.; Zett. I. L. *Tipula* p., Zett. I. L.

Corpus mediocre, elongatum, angustum, glabriculum. Caput parvum, subclavatum. Oculi rotundi, remoti. Proboscis longiuscula. Palpi 4-articulati, crassiusculi, cylindrici, incurvi; articulus quartus paullo longior. Antennæ 17-articulatæ, porrectæ, simplices, subfiliformes; articulus primus breviusculus, cyathiformis; secundus subglobosus; tertius et sequentes oblongiusculi, subcylindrici, pilosi. Thorax convexus. Alæ incumbentes, modice angustæ. Abdomen segmentis octo, elongatum, subdepressum, basi valde angustatum, apud medium subdilatatum. Pedes graciles, longiusculi, inermes; coxæ breves; tibiæ posticæ calcaribus minutis apicalibus. *Mas.* Autennæ thorace paullo longiores; articuli subcylindrici. Abdomen apice clavatum, forcipibus extensis latis fornicatis. *Fœm.* Antennæ thorace paullo breviores; articuli subrotundati. Abdomen apice subtumidum, lamellis lateralibus subfoliaccis breviter acutis.

Body elongated, narrow, almost smooth, of moderate size, yellowish in the European species. Head rather small, obpyriform. Eyes round, remote. Proboscis moderately lengthened. Palpi four-jointed, exerted, cylindrical, rather thick, curved downward; fourth joint rather longer than the others. Antennæ with seventeen joints, porrect, pilose, simple, nearly filiform, as long as the thorax; first and second joints bare; first cyathiform, rather short; second subglobose; the rest oblong, nearly cylindrical. Thorax convex. Wings incumbent, bare, unspotted, long, rather narrow; mediastinal vein ending at three-fourths of the length of the wing, joined to the subcostal by a veinlet near its tip, which is free; subcostal joining the radial at four-fifths of

the length, united also to the costal near its tip by a veinlet, which is opposite the middle of the stigma; radial and cubital springing from a common petiole, which they rather exceed in length, and which proceeds from the subcostal at half the length of the wing; cubital joined close to its base to the third externo-medial by a veinlet, whose angle emits the first externo-medial; the latter is forked at half its length, and is joined very near its fork to the third externo-medial by a veinlet, whose angle emits the second externo-medial; third externo-medial joined to the subanal by a veinlet at one-third of the length of the discal areolet; subanal curved hindward at its tip; anal and axillary complete; discal areolet long, hexagonal. Abdomen with eight segments, elongated, slightly depressed, very narrow at the base, slightly widened about the middle. Legs slender, rather long, nearly bare, unarmed; coxae not elongated; posterior tibiæ with minute apical spurs. *Male.* Antennæ a little longer than the thorax; joints nearly cylindrical. Abdomen clavate at the tip; the forceps extended, broad, curved. *Fem.* Antennæ a little shorter than the thorax; joints nearly round. Abdomen somewhat tumid at the tip, with subfoliaceous, acute, lateral lamellæ.

1. ***distinctissima***, Wied.; Meig. Z. i. 131. 27 (1818); Mcq.; Schumm.; Zett.; Stæg.; Ross. (V.)—*brevicornis*, Zett. I. L. Testacea, palpis antennis thoracis disco maculisque quatuor lateralibus nigris, metathorace pectoreque nigro-unimaculatis, alis subcinereis, abdominis apice nigro, femoribus apice tibiis tarsisque nigris. Long. 5-6; alar. 9-11 lin.

Testaceous. Palpi and antennæ black, testaceous at the base. *Disc of the thorax black*; two black dots on each side, and one on the metathorax; a large black spot on the pectus. Wings greyish; stigma brown. Halteres pale testaceous, with black knobs. Abdomen dull testaceous, black at the tip. Legs black; femora dull testaceous, with black tips.

Not common. Inhabits woods. (E. S. I.)

2. ***diversa***, n. Cana, thorace vittis tribus nigricantibus, alis lurido-cinereis, abdomine vitta dorsali nigricante, pedibus testaceis, femoribus tibiisque apice tarsisque nigris. Long. 6; alar. 10 lin.

Hoary. Palpi and antennæ black. *Thorax with three blackish stripes*. Wings lurid-grey; stigma brown. Halteres brownish. Abdomen lurid, with a blackish dorsal stripe. Legs dull testaceous; tips of the femora, of the tibiæ, and of the tarsi, black.

This species differs from the typeal *C. distinctissima* in the following characters of the wing-veins:—Veinlet between the subcostal and the costal more oblique; veinlet between the eubital and the third externo-medial much further from the base of the eubital; discal areolet nearly tetragonal. Rare. (S.)

stigma; radial connected with the subcostal by a transverse veinlet at the tip of the stigma; cubital connected with the third externo-medial by a transverse veinlet; the angle of the latter emits the first externo-medial, which is forked before one-third of its length, and its fore fork is again divided at two-thirds of the length; third externo-medial connected with the subanal by an oblique veinlet, which is nearer than the veinlet in front to the tip of the wing; subanal vein and anal vein complete. No discal areolet. Halteres long. Abdomen with eight segments, slender. Legs long, slender, unarmed; femora and tibiæ of nearly equal length; tarsi very long, almost twice the length of the tibiæ. *Male.* Antennæ rather longer than the head and the thorax. *Fem.* Antennæ rather shorter.

The only known species of this genus may be at once distinguished from all the other British *Tipulidæ* by its long and very slender white tarsi.

1. **Chirothecata**, Scop. Ent. Carn. (1763).—*albipes*, Müll. Prodr. (1776).—*sylvicola*, Curt. B. E. 62; Meig.; Stæg.; Ross. (V.); Loew; Zett. Testacea, vertice antennis thoracisque disco fuscis, alis subcinnereis, abdomine fusco, tarsis albis. Long. 5; alar. 11 lin.

Testaceous. Vertex and disc of the thorax brown. Antennæ brown, testaceous at the base. Scutellum and sutures in front of it testaceous. Wings greyish; stigma dark brown; veins black, tawny towards the base. Halteres testaceous, with brownish knobs. Abdomen brown, testaceous at the tips. Legs dull testaceous; tarsi white towards the tips.

Inhabits shady woods, where it rests on the trunks of trees. (E. S. I.)

---

#### Genus XIV. NEPHROTOMA.

**NEPHROTOMA**, Meig. Zw. i. 202 (1818); Meq.; Stæg.; Zett. *Tipula* p., F.; Gmel.; Latr.

Corpus mediocre, elongatum, cylindricum, glabriculum. Caput rotundatum. Frons antice prominula. Oculi remoti. Proboscis breviusecula, crassiuscula, cylindrica, apice superne acuta. Palpi 4-articulati, incurvi, subcylindrici; articuli primus, secundus, et tertius subæquales; quartus longior et paullo angustior. Antennæ pilosæ; articuli primus et tertius subcylindrici; secundus cyathiformis. Prothorax distinctus. Thorax ellipticus, convexus. Scutellum parvum. Alæ lanceolatae, divaricatae, apice rotundatae. Pedes longi, tenues, subnudi, inermes; tibiæ calcaribus brevissimis. *Mas.* Antennæ 19-articulatae, arcuatim porrectæ, thorace longiores; articulus primus modice longus, apice nonnihil incrassatus; secundus brevissimus; tertius elongatus; quartus et sequentes subtus medio excisi; ultimi

simpliees. Abdomen ano obtuso, subelavato, appendiculato. *Fœm.* Antennæ 15-articulatae, capite saltem duplo longiores; articulus quartus et sequentes subeylindrici, basi paullo erassiores. Abdomen stylis duabus rectis subulatis.

Body long, cylindrieal, nearly smooth, of moderate size. Head nearly round, slightly attenuated hindward. Front prominent in front. Proboscis cylindrieal, rather short and thick, acute at the tip above. Palpi four-jointed, deecumbent, nearly cylindrieal; first, second, and third joints of nearly equal length; fourth longer, and a little more slender. Antennæ pilose; second joint eyathiform. Prothorax distinct. Thorax elliptical. Scutellum small. Wings lanceolate, divaricated, rounded at the tips; subcostal vein approaching the costa at the stigma, then receding from it and joining it at four-fifths of the length, connected with the radial by a short veinlet adjoining the stigma; radial and cubital springing from a common petiole which is about one-fourth of their length, and proceeds from the subcostal at two-thirds of the length; cubital forked very near its base, its hind fork forming an angle near the base, and there connected by a transverse veinlet with the third externo-medial; the middle of this veinlet emits the second externo-medial, and the latter is connected with the cubital by another veinlet which forms an angle in front, and there emits the first externo-medial; third externo-medial angular at its junction with the veinlet, which is continued across it to the subanal; anal and axillary complete; discal areolet pentagonal. Abdomen long, cylindrieal, with eight segments. Legs long, slender, nearly bare, unarmed; tibiæ with two very short apical spurs. *Male.* Antennæ nineteen-jointed, a little longer than the head and the thorax; first joint moderately long, slightly incrassated at the tip; second very short; third elongated, cylindrieal; fourth and following joints notched in the middle beneath; apical joints entire. Abdomen at the tip obtuse, subelavate, with appendages. *Fœm.* Antennæ fifteen-jointed, at least twice the length of the head; first and third joints nearly cylindrieal; fourth and following joints also nearly cylindrieal, a little thicker at the base. Abdomen with two straight subulate anal styles.

1. **dorsalis**, F. Sp. Ins. ii. 403. 14 (1781); Gmel.; Latr.; Meig.; Meq.; Stæg.; Zett. *Mas et Fœm.* flava, verticis macula lanceolata palpis antennis thoracisque vittis tribus fuscis, alis vix subcinereis ad costam subtestaceis, stigmata pallidissime fusco, abdomine pallide luteo, vitta dorsali interrupta nigra, pedibus pallide luteis, femoribus tibiisque apice tarsisque fuscis. Long. 7-8; alar. 12 lin.

*Male and Fem.* Yellow. Vertex with a lanceolate brown mark. Palpi and antennæ brown, the latter yellow at the base. Thorax with three brown stripes, the lateral pair abbreviated; hind part with a luteous stripe. Wings hardly greyish, with an indistinct testaceous tinge in front; veins brown, testaceous at the base; stigma small, very pale brown. Halteres brown, testaceous towards the base. Abdomen pale lu-

cure situation. All however were not committed to the same burrow, for she every now and then shifted her station, but not more than an inch from where she bored last."

Synopsis of the British species:—

- a.* Fork of the first externo-medial vein with a petiole between it and the discal areolet.
- b.* Wings of one colour, excepting the rather darker fore border and the stigma, and some distinct brown longitudinal marks, or with only three small brown spots, two on the hind border and one on the subanatal vein.—*T. notatae*, Schumm. Species 1.
- b b.* Wings much variegated, with three large brown spots on the fore border, three paler brown spots on the hind border, and a small brown spot on the anal vein.—*T. maculatae*, Schumm. Species 2.
- b b b.* Wings more or less variegated with grey and white, of almost one colour in some species.—*T. marmoratae*, Schumm.
- c.* Sides of the thorax with some conspicuous blackish-brown streaks. Species 3.
- c c.* Sides of the thorax without brown streaks.
- d.* Thorax with four brown stripes, which have not darker borders. Species 4–7.
- d d.* Thorax with four (rarely three) brownish-grey or grey stripes, with darker brown borders. Species 8, 9.
- d d d.* Thorax with three generally brown bordered stripes, of which the middle one is intersected by a dark brown stripe. Species 10.
- b b b.* Wings more or less variegated. Fore border darker than the wings elsewhere. Subanatal vein towards its tip, the veinlet between it and the third externo-medial, wholly clouded with brown; the postbraehial areolet of one colour, without paler spots at the tip, the apical space of one colour, or with white bands.—*T. costato-nervosæ*, Schumm.
- c.* Abdomen with darker lateral stripes. Species 11, 12.
- c c.* Abdomen with a darker dorsal stripe. Species 13.
- b b b b.* Wings of one colour; limpid, with a dark brownish-yellow, brown or blackish fore border. Apical part of one colour, only the areolets in front of the discal areolet at the base more or less, or almost wholly, limpid.—*T. costatae*, Schumm. Species 14–18.
- b b b b b.* Wings almost of one colour, with the costa not distinctly darker; the inner costal areolet partly whitish.—*T. unicoloræ*, Schumm.
- c.* Abdomen without stripes. Species 19–22.
- c c.* Abdomen with a darker dorsal stripe. Species 23, 24.
- b b b b b.* Wings of one colour, occasionally darker in the apical part, with a white band which proceeds from the costa at the

- base of the stigma and extends to the discal areolet or to the externo-medial areolet beyond it.—*T. lunato-fasciatæ*, Schumm.  
*c. Abdomen ashy-grey.* Species 25.  
*c c. Abdomen luteous or testaceous.* Species 26–30.  
*a a. Fork of the first externo-medial vein sessile.*  
*b. Abdomen without stripes.*—*T. unicoloris*, Schumm. Species 31.  
*b b. Abdomen with three or four whole or interrupted brown or black stripes.*—*T. vittata*, Schumm.  
*c. Wings with a dark brown costa.* Species 32, 33.  
*c c. Wings with a pale brown or brownish-yellow costa.*  
*d. Side stripes of the thorax straight.* Species 34.  
*d d. Side stripes of the thorax curved.* Species 35.  
*b b b. Abdomen with luteous or yellow bands.*—*T. fasciatæ*, Schumm.  
Species 36, 37.  
*b b b b. Abdomen almost black, with two rows of yellow spots, which are sometimes almost confluent, and form two stripes.*—*T. seriato-maculatæ*, Schumm. *T. pratensis*, L., belongs to this section, and has been recorded as British, perhaps erroneously.

1. ***lutescens***, F. S. A. 24. 6 (1805); Meig.; Mcq.; Schumm.; Gimm.; Stæg.; Ross. (V.).—*fulvipennis*, D. G.; Meig. Klass. Cana, thorace vittis quatuor fuscous, alis macula apud stigma strigaque costali albidis, stigmate fulvo, abdomine vitta nigricante, pedibus testaccis; *Mas*, alis cinereis; *Fæm.* alis luridis. Long. 8–11; alar. 18–22 lin.

Hoary. Proboscis ferruginous. Palpi brownish. Antennæ tawny. Thorax testaceous in front and along each side, with four pale brownish stripes with darker borders, the outer pair short. Wings with a whitish spot by the stigma, and a whitish streak between the stigma and the base, slightly clouded with grey towards the tips, and with a grey spot between the subanal vein and the anal vein; stigma tawny. Halteres blackish, whitish at the base of the club, which is hoary. Abdomen with a blackish stripe along each side; tip ferruginous. Legs testaceous, pubescent; tips of the femora ferruginous. *Male.* Wings grey. *Fem.* Wings lurid.

Not rare. (E. S. I.)

2. ***gigantea***, Schr. Beitr. (1776); I. A. 845 (1781); Gmel.; Latr.; Meig.; Mcq.; Schumm.; Gimm.; Stæg.; Ross. (V.); Zett.—*rivosa*, Scop. Ent. Carn. 318. 846 (1763).—*sinuata*, F.; Gmel.—*hortorum*, Herbst. Ferruginea, thorace cano vittis tribus fuscis, alis cinereis apud costam fuscis, vitta discali albida, femoribus tibiisque apice tarsisque nigris. Long. 10–18; alar. 22–26 lin.

Ferruginous, with whitish tomentum. Antennæ not twice the length of the proboscis. Palpi black, ferruginous towards the base. Thorax hoary, with three brown stripes; incisures, postscutellum, and pectus whitish. Wings brown in front, grey behind, both colours indented by a whitish irregular angular discal stripe. Abdomen grey at the tip.

Wings greyish, with several whitish spots, and with three brown spots along the costa, and with a fourth between the subanal vein and the anal vein; stigma brown. Halteres testaceous, with brownish knobs. Abdomen testaceous, with a black stripe on each side. Legs testaceous; tarsi and tips of the femora and of the tibiæ black.

Common. (E. S. I.)

10. **pabulina**, Meig. Zw. i. 180. 16 (1818); Mcq.; Schumm.; Stæg.; Zett.—*hortorum?* L. Cinerea, thorace vittis quatuor fuscis, alis subcinereis maculis diffusis albidis, stigmate fusco, abdomine cinereo-fusco segmentorum marginibus basique testaceis, pedibus testaceis. Long. 5–7; alar. 14–16 lin.

Cinereous. Proboscis ferruginous. Palpi and antennæ black, testaceous towards the base. Thorax with four brown stripes; sides, pectus, and metathorax hoary. Wings very slightly greyish, with four irregular whitish spots in the disc, and one between the tip and the stigma, which is brown; transverse veinlets slightly clouded with brown. Halteres testaceous; clubs partly brown. Abdomen greyish-brown; hind borders of the segments and base testaceous. Legs testaceous; femora and tibiæ darker at the tips; tarsi black towards the tips.

Common. (E. S. I.)

11. **lateralis**, Meig. Zw. i. 174. 6 (1818); Mcq.; Schumm.; Zett.; Stæg.; Ross. (V.). Cana, thoracis disco cinereo-fusco vittis duabus canis, alis cinereis signa obliqua alba, abdomine supra cinereo-fusco vitta caua, pedibus testaceis, femoribus tibiisque apice tarsisque nigris. Long. 5–7; alar. 12–14 lin.

Greyish-brown. Head hoary in front and beneath. Palpi and antennæ black. Thorax with two hoary stripes; fore part, hind part, sides, and pectus hoary. Wings grey, with an oblique white mark by the stigma, which is blackish; transverse veinlets clouded with black. Halteres testaceous; knobs black. Dorsal stripe and under side of the abdomen hoary. Legs testaceous; tarsi and tips of the femora and of the tibiæ black.

Common. (E. S. I.)

12. **marginata?** Meig. Zw. i. 173. 5 (1818); Mcq.; Schumm.; Stæg.; Zett. Cana, thorace vittis sex indistinctis cinereis, alis cinereis albo-univittatis et unimaculatis, abdomine vittis duabus lateralibus nigris, pedibus testaceis, femoribus tibiisque apice tarsisque nigricantibus. Long. 7–8; alar. 14–16 lin.

Hoary. Proboscis picceous. Palpi and antennæ black, the latter testaceous at the base. Thorax with six indistinct cinereous stripes: metathorax and pectus whitish. Wings grey, with a white spot between the subanal vein and the third externo-medial vein, connected with a white undulating stripe, which is dilated at the base, and extends from near the discal spot to the tip. Halteres picceous. Abdomen with a black stripe

along each side. Legs testaceous, pubescent; femora and tibiæ towards the tips and tarsi blackish.

Not common. (E.)

13. **vernalis**, Meig. Zw. i. 182. 19 (1818); Mcq.; Schumm.; Gimm.; Stæg.; Ross. (V.); Zett. *Cana, thorace vittis tribus fuscis, alis cinereis apud discum albidis, abdomine fulvo vitta dorsali nigra, pedibus fulvis, femoribus tibiisque apice tarsisque nigris.* Long. 5–6; alar. 12–14 lin.

Hoary. Proboscis ferruginous on each side. Palpi and antennæ black; second joint of the antennæ testaceous. Thorax with three brown stripes, the middle one very broad. Wings grey, whitish in most of the disc, the white part terminating by the discal areolet, and by the stigma, which is brown; transverse veinlets slightly clouded with brown. Halteres testaceous, with blackish knobs. Abdomen tawny, with a black dorsal stripe, which is interrupted on the hind border of each segment. Legs tawny, rather short; tips of the femora, tibiæ towards the tips, and tarsi, black.

Not rare. (E. S. I.)

14. **paludosa**, Meig. Zw. vi. 289. 50 (1830); Schumm.; Stæg.; Zett. *Cinerea, thorace vittis quatuor nigris, alis subcinereis parvis, abdomine ferrugineo, pedibus fulvis validis, femoribus tibiisque apice tarsisque nigris.* Long. 7–11; alar. 10–16 lin.

*Cinereous.* Proboscis tawny. Palpi and antennæ tawny, black towards the tips. Thorax with four indistinct slender black stripes; metathorax and pectus whitish. *Wings short*, grey, with a slight lurid tinge, brown along the costa. Halteres testaceous; knobs tawny. Abdomen long, especially in the female, ferruginous. Legs tawny, stout, pubescent; femora and tibiæ with black tips; tarsi black, tawny towards the base.

Not common. (E. I.)

15. **oleracea**, L. F. S. 1740 (1761); F.; D. G.; Schr.; Gmel.; Latr.; Meig.; Mcq.; Zett.; Schumm.; Gimm.; Stæg.; Ross. (V.). *Cana, thorace vittis quatuor fuscis, alis subcinereis ad costam luridis vitta subcostali limpida, pedibus testaceis, femoribus tibiisque apice tarsisque nigris.* Long. 7–10; alar. 14–20 lin.

*Hoary.* Proboscis tawny. Palpi brown. Antennæ black, tawny towards the base. Thorax with four indistinct brown stripes. Metathorax and pectus whitish. Wings slightly greyish, lurid along the costa, and with a limpid stripe behind it. Halteres testaceous, blackish at each end. Hind borders of the abdominal segments testaceous. Legs testaceous, pubescent; femora and tibiæ generally blackish at the tips; tarsi black, testaceous towards the base. *Male.* Abdomen testaceous at the tip. *Fem.* Abdomen tawny at the tip.

Generally distributed. (E. S. I.)

16. **flavolineata**, Meig. Zw. i. 185. 24 (1818); Mcq.; Stæg.;

Common on mountains and moors ; more rare in cultivated low-lands. (E. I.)

23. **melanoceras**, Schumm. Tip. 75. 30 (1833). *Fem.* cana, *antennis nigris, thorace vittis tribus fuscis media lata macula laterali alba, alis limpidis, stigmate fusco, abdomine lurido vitta dorsali fusca, pedibus testaceis, femoribus tibiis tarsisque apice fuscis.* Long. 7 ; alar. 12 lin.

*Fem.* Hoary. *Antennæ black*, very much shorter than the thorax. *Thorax with three brown stripes*, the middle one broad ; the lateral pair short and slender ; a white spot on each side. Wings limpid ; veins brown, testaceous towards the base and along the costa ; stigma small, brown. Halteres testaceous. Abdomen lurid, with a brown dorsal stripe. Legs testaceous, rather stout ; tips of the femora, of the tibiæ, and of the tarsi, brown.

Very rare. In Mr. Haliday's collection. (I.)

24. **luteipennis**, Meig. Zw. vi. 288. 48 (1830) ; Schumm. ; Stæg. ; Zett. Cana, *antennis fuscis basi testaceis, thorace vittis quatuor dorsalibus fuscis duabusque lateralibus flavis, alis subcinereis basi costaque luridis, stigmate flavo, abdomine nigricante vitta lutea marginibus subapicalibus flavis, pedibus fulvis, femoribus tibiisque apice tarsisque nigris.* Long. 10–11 ; alar. 18–20 lin.

Hoary. Head beneath and palpi testaceous. *Antennæ brown, testaceous towards the base.* *Thorax with a yellow stripe on each side, and with four brown dorsal stripes.* Wings very slightly greyish, with a lurid tinge at the base and along the fore border ; stigma yellow ; veins black, tawny towards the base. Halteres testaceous, with brownish tips. Abdomen blackish, with a luteous stripe above and another beneath ; hind borders of the segments towards the tip yellow ; tip ferruginous. Legs tawny ; tarsi towards the tips, and tips of the femora and of the tibiæ black. *Fem.* Antennæ rather more than twice the length of the proboscis.

Much resembles *T. flavolineata*, but the abdomen is shorter and less compressed, and the stigma is wholly yellow. Rare. (E. I.)

25. **lunata**, L. F. S. 1744 (1761) ; D. G. ; Schr. ; Gmel. ; Latr. ; Meig. ; Mcq. ; Schumm. ; Stæg. ; Zett. Cana, *thorace vittis quatuor fuscis, alis subcinereis fascia obliqua alba, abdominis apice testaceo, pedibus nigris, femoribus tibiisque basi pallidis.* Long. 6–7 ; alar. 14–15 lin.

Hoary. Palpi and antennæ black, the latter tawny towards the base in the male. Thorax with four brown stripes, the lateral pair short. Metathorax and pectus white. Wings slightly grey, with an oblique white band behind the stigma, which is brown. Halteres testaceous, with brown knobs. Abdomen testaceous at the tip. Legs

black ; femora tawny, with black tips ; tibiæ ferruginous towards the base.

Not rare. (E.)

26. **ochracea**, Meig. Zw. i. 186. 25 (1818); Mcq.; Zett.; Schumm.; Gimm.; Stæg.; Ross. (V).—*lunata*, F. *Testacea*, alis subcinereis fascia obliqua alba, femoribus apice tarsisque fuscis. Long. 7–8 ; alar. 16 lin.

*Testaceous*. Palpi black towards the tips. Antennæ black, testaceous towards the base. Wings slightly greyish, with a short oblique white band by the stigma, which is brown. Halteres with brownish knobs. Abdomen occasionally with a greyish dorsal stripe ; tip ferruginous. Tarsi and tips of the femora brown.

Common. (E. S. I.)

27. **Selene**, Meig. Zw. vi. 288. 49 (1830) ; Schumm. ; Stæg. ; Zett. *Cinerea, thorace vittis quatuor fuscis*, alis subcinereis fascia brevi alba, stigmate fusco, abdomine nigro-cinereo vittis lateralibus luridis, pedibus fulvis, femoribus tibiisque apice tarsisque nigris. Long. 11 ; alar. 22 lin.

*Cinereous*. Proboscis and palpi tawny. Antennæ black, testaceous towards the base. *Thorax with four brown stripes*, the outer pair short. Pectus and metathorax whitish. Wings greyish, with a short white band adjoining the stigma, which is brown. Halteres testaceous, with blackish knobs. Abdomen blackish-grey, with a lurid stripe extending along each side, and dilated towards the base. Legs tawny ; tarsi and tips of the femora and of the tibiæ black.

Not common. (E.)

28. **fascipennis**, Hoffm. ; Meig. Zw. i. 187. 26 (1818) ; Mcq. ; Schumm. ; Zett. ; Gimm. ; Stæg. *Albida*, capite fulvo, thoracis disco fusco, alis subcinereis fascia obliqua alba, abdomine lurido vitta dorsali apiceque piceis, pedibus nigris, femoribus basi testaceis. Long. 6–7 ; alar. 16 lin.

*Brown*. Head tawny. Palpi and antennæ black, the latter tawny at the base. *Sides of the thorax, metathorax, and pectus whitish*. Wings greyish, with a slight testaceous tinge along the costa, and with an oblique white band behind the stigma, which is whitish-testaceous, bordered with grey. Halteres testaceous, with brown knobs. Abdomen lurid ; dorsal stripe and tip piceous. Legs black ; femora testaceous, blackish towards the tips.

Not rare. (E. S. I.)

29. **Selenitica**, Hoffm. ; Meig. Zw. i. 187. 27 (1818). *Ochracea, thorace vittis quatuor fuscis*, alis subcinereis fascia areuata alba, stigmate flavo, abdomine vittis tribus fuscis, pedibus testaceis, tarsis nigricantibus. Long. 8 ; alar. 14 lin.

*Fem. Ochraceous*. Palpi hairy, black towards the tips. Antennæ brown, testaceous towards the base, about twice the length of the proboscis. *Thorax with four brown stripes*. Wings greyish, with a slight

at the base. Thorax with three black stripes; the middle pair short. Pectus and sides of the thorax pale yellow, with a few black spots; metathorax with a brown stripe. *Wings limpid*; stigma brown; veins between the stigma and the hind border slightly clouded with brown. Halteres yellow. Abdomen testaceous, with three brown stripes; the dorsal stripe moderately broad; the lateral stripes narrow. Legs testaceous; tarsi and tips of the femora and of the tibiæ blackish.

Generally distributed. (E. S. I.)

33. **quadrifaria**, Meig. Zw. i. 199. 43 (1818); Schumm.; Curt. Flava, capite macula nigra, antennis nigris basi testaceis, thorace vittis tribus nigris, alis sublimpidis fascia fusca, stigmate nigro-fusco, abdomine vitta nigra, pedibus testaceis, femoribus tibiisque apice tarsisque nigris. Long.  $5\frac{1}{2}$ -6; alar. 12 lin.

Yellow. Head luteous, with a triangular black spot behind. Proboscis brownish above. Antennæ black, testaceous towards the base. Thorax with three broad black stripes; the lateral pair including two yellow spots; metathorax with three black stripes. Pectus with black spots. *Wings nearly limpid, with a more or less conspicuous brown band* behind the stigma, which is dark brown; tips generally greyish. Halteres testaceous, or brown. Abdomen with a black dorsal stripe. Legs testaceous; tarsi and tips of the femora and of the tibiæ black. *Male*. Dorsal stripe of the abdomen interrupted on the fore border of each segment. *Fem.* Dorsal stripe of the abdomen dilated on the hind border of each segment.

Not rare. (E.)

34. **scurra**, Hoffm.; Meig. Zw. i. 198. 41 (1818); Mcq.; Zett.; Schumm.; Stæg.; Ross. (V.). Luteo-flava, capite macula nigra, thorace vittis tribus nigris, alis subluridis, stigmate pallide fusco, abdomine vitta nigra, pedibus luteis, femoribus tibiisque apice tarsisque nigris. Long. 5-6; alar. 10-11 lin.

Luteous-yellow. Head with a triangular black spot behind. Proboscis with a black stripe above. Palpi and antennæ black, the latter luteous at the base. Thorax with three black stripes, the lateral pair short; sides and pectus with black spots. Wings slightly lurid; stigma very pale brown. Halteres yellowish. Abdomen with a black stripe above and below, interrupted in the female. Legs luteous; tarsi and tips of the femora and of the tibiæ black.

This species closely resembles *P. pratensis*, but may be distinguished by its deeper colour, the different form of the stripes and spots of the thorax, and the lurid tinge of the wings. Not common. (E. I.)

35. **flavescens**, L.; F. E. S. iv. 237. 13 (1792); Meig.; Mcq.; Schumm.; Stæg.; Ross. (V.).—*flavo-maculata*, D. G.—*lineata*, Schr.—*maculosa*, Zett. I. L. Flava, capite macula nigra, palpis antennisque nigris, thorace vittis tribus nigris, alis subeineercis, stigmate pallide

fusco, abdomine luteo fascia interrupta maculisque lateralibus nigris, pedibus nigris, femoribus basi fulvis. Long.  $4\frac{1}{2}$ –6; alar. 9–11 lin.

*Yellow.* Head luteous, with a black triangular spot behind, *and a black dot on each side.* Proboscis with a black stripe above. Palpi and antennæ black. Thorax with three black stripes, the lateral pair short; sides and pectus with black spots. Wings greyish, narrower than those of *P. pratensis*, with a testaceous tinge along the costa; stigma pale brown. Halteres testaceous, with blackish knobs. Abdomen luteous, with an interrupted black stripe; a row of black spots along each side. Legs black; femora tawny, black towards the tips.

Common. (E. S. I.)

36. **imperialis**, Meg.; Meig. Zw. i. 196. 39 (1818); Mcq.; Schumm.; Stæg.; Zett.—*scalaris*, Hoffm.; Meig.; Ross. (V.). *Flava*, capite luteo striga nigra, antennis nigris basi pallidis, thorace vittis tribus nigris, *alis sublimpidis*, abdomine vitta dorsali interrupta nigra, pedibus testaceis, femoribus tibiisque apice tarsisque nigris. Long. 8–9; alar. 14–15 lin.

*Yellow.* Head luteous, with a black streak behind. Proboscis and palpi testaceous. Antennæ black, luteous, or yellow at the base. Thorax with three broad black stripes, the middle one in advance; scutellum brown. Metathorax with a brown stripe, and sometimes with a brown spot, on each side. *Wings nearly limpid*; stigma dark brown; veins black, testaceous at the base. Halteres testaceous; club partly brown. Abdomen with a black dorsal stripe, which is generally interrupted on the fore border of each segment. Legs testaceous, long, slender; tarsi, except towards the base, and tips of the femora and of the tibiæ, black.

Not rare. (E. S. I.)

37. **crocata**, L. F. S. 1739 (1761); F.; Gmel.; Meig.; Mcq.; Gimm.; Zett.; Schumm.; Stæg.; Ross. (V.).—*flavo-fasciata*, D. G. *Atra*, macula verticis, thoracis fascia antica maculisque lateralibus flavis, *alis cinereis fusco-nebulosis*, stigmate nigro, abdomine fasciis tribus luteis, femoribus basi fulvis. Long. 10; alar. 12 lin.

Deep black. Head with a luteous spot on the vertex. Thorax with a short yellow band in front, and with luteous spots along each side. *Wings grey, more or less clouded with brown*; stigma black. Halteres piceous. Abdomen with three luteous bands; femora tawny towards the base.

Not common. (E. I.)

### Genus XVI. Ctenophora.

CTENOPHORA, F. S. A. 17 (1805); Meig.; Curt.; Mcq.; Zett.; Gimm. *Tipula* p., L.; Schr.; F. E. S.; Gmel. *Tanyptera*, Latr. *Dictenidia* et *Xiphura*, Brullé.

Corpus magnum, oblongum, robustum, glabriulum, sapissime nitidum.

this species the six leg-cases are of the same length, exactly parallel and adjacent, and being annulated, have the appearance of traeheæ. The abdomen is armed with several strong conical spines, pointing mostly towards the tail: these spines assist in pushing the pupa out of the tree.

3. **flaveolata**, F. E. S. iv. 234. 6 (1792); Latr.; Meig.; Curt.; Mcq.; Gimm.; Stæg.; Ross. (V). — *crocata*, Schr. *Nigra, thorace vittis duabus flavis, alis subflavescens macula costali fusca, abdominis segmentis flavo-fasciatis, pedibus luteis, tarsis nigris*. Long. 9; alar. 15 lin.

*Black*. Mouth tawny above. Palpi tawny towards the base. Antennæ tawny, brownish about the middle part. Thorax yellow in front, and *with a yellow stripe on each side*, and behind the wings with a whitish line on each side. Wings slightly yellowish, with a brown spot at the tip of the subcostal vein, and from thence to the tips with a slight brownish tinge along the costa. Halteres tawny. Abdomen yellow at the base, and *with a yellow band on the hind border of each segment*; tip ferruginous. Legs luteous; tarsi black, tawny towards the base.

Rare. (E.)

4. **ornata**, Meg.; Meig. Zw. i. 166. 10 (1818); Curt. ! B. E. i. 5. *Flava luteo varia, antennis pedibusque luteis, thoracis disco nigro fascia lutea, alis hyalinis apud costam fulvis, macula subapicali nigra, abdomine basi apiceque fasciis maculaque intermedia trigona nigris, tarsis nigris*. Long. 8; alar. 16 lin.

*Yellow*, partly luteous. Antennæ and legs luteous. *Disc of the thorax black*, with the exception of a luteous band behind the middle. Wings hyaline, tawny along the costa, with a large costal subapical black spot. *Abdomen with a black band on each segment, with the exception of the middle part, which contains a triangular black spot*. Tarsi black.

Very rare. In Mr. Dale's collection. (E.)

5. **atrata**, L. F. S. 1749 (1761); F.; Schr.; Gmel.; Latr.; Meig.; Mcq.; Curt.; Zett.; Gimm.; Ross. (V). — *ichneumonea*, D. G.; Latr. — *Villantiana*, Brullé. — *ruficornis*, Stæg. *Nigra, antennis pedibusque fulvis, alis subluridis, abdomine basi luteo, tarsis piccis*. Long. 10–12; alar. 13–15 lin.

*Black*, shining. *Antennæ tawny*, black at the base, brown towards the tips; fourth, fifth, sixth, and seventh joints white at the base. Wings with a slight lurid tinge; a brown spot at the tip of the subcostal vein. Halteres piceous. Abdomen luteous towards the base. Legs tawny; tarsi picrous, black towards the tips.

Not common. (E. S.)

6. **nigricornis**, Meig. Zw. i. 159. 4 (1818); Meq.; Curt.; Zett. — *atrata*, Meig. Kl. *Nigra, antennis nigris, alis subcinereis, abdomine*

basi pedibusque luteis, femoribus tibiisque apice tarxisque nigris. Long. 6-7; alar. 8-10 lin.

Black, shining. *Antennæ black.* Wings slightly greyish, slightly testaceous at the base, with a brown spot at the tip of the subcostal vein. Halteres ferruginous. Abdomen luteous towards the base. Legs luteous; tarsi and tips of the femora and of the tibiæ black.

Not common. (E. S.)

---

### Genus XVII. **PTYCHOPTERA.**

**PTYCHOPTERA**, F. S. A. 20 (1805); Meig.; Mcq.; Zett.; Gimml.; Stæg. *Tipula* p., L.; F. E. S.; Scop.; Schr.; Gmel.; Latr.

Corpus magnum aut mediocre, elongatum, nitidum, glabriculum. Caput sessile. Oculi rotundi, remoti. Proboscis exserta, capitulo magno carnoso. Palpi 4-articulati, elongati, filiformes, incurvi, pilosuli; articulus primus brevis; secundus et tertius paullo longiores, æquales; quartus longissimus, setacus. Antennæ 16-articulatæ, porrectæ, filiformes, pilosulæ; articulus primus brevis, erassiusculus, cylindricus; secundus brevissimus, cyathiformis; tertius longissimus, filiformis; quartus et sequentes oblongi; sextus-decimus minor. Prothorax indistinctus. Thorax ovatus, supra convexus, striatus, antice nonnihil prominulus. Scutellum parvum. Metathorax convexiusculus, sat magnus. Alæ divaricatae, modice latæ, abdominis longitudine. Abdomen segmentis octo, basi angustatum. Pedes mediocre, subpubescentes, inermes; coxæ modice longæ; femora apices versus leniter crassiora; tibiæ apice calcaratae. *Mas.* Antennæ thorace paullo longiores. Abdomen apicem versus paullo incrassatum; anus modice crassus, breviusculus, parum reflexus, appendiculis 4 magis exsertis subclavatis munitus. *Fœm.* Antennæ thorace paullo breviores. Abdomen apicem versus distincte incrassatum; apex acutus, stylis analibus 2 modice longis, ensiformibus, parallelis, leniter incurvis.

Body large or of moderate size, elongated, shining, nearly bare. Head sessile, transverse. Eyes round, remote. Rostrum rather short, slightly acute above in front. Proboscis prominent, with a large fleshy head. Palpi four-jointed, elongated, filiform, curved downward, somewhat pilose; first joint short; second and third rather longer, of equal length; fourth very long, setaceous. Antennæ sixteen-jointed, porrect, filiform, slightly pilose; first joint short, cylindric, rather thick; second cyathiform, very short; third filiform, very long; fourth and following joints oblong; sixteenth smaller. Prothorax indistinct. Thorax oval, convex, striated, slightly prominent in front. Scutellum small. Metathorax rather large, slightly convex. Wings divaricate, moderately broad, as long as the abdomen. Mediastinal vein ending at a little beyond two-thirds of the length of the wing; subcostal ending at five-sixths of the length, connected with the radial by a very short

pedibus testaceis, femoribus tibiisque apice tarsisque nigris. Long.  $3\frac{1}{2}$ –4; alar. 7–8 lin.

Black. Proboscis and palpi tawny. Thorax with a tawny suture between the wings. Scutellum tawny. Wings slightly greyish. Halteres testaceous. Abdomen testaceous at the tip. Legs testaceous; tarsi, except at the base, and tips of the femora and of the tibiæ, black.

Perhaps a variety of *P. fasciata*. Rare. (E.)

## FAMILY XI. RHYPHIDÆ.

Ocelli tres. Mesothoracis scutum integrum. Alæ sat latæ; areola discalis completa.

Ocelli three. Scutum of the mesonotum undivided. Wings and halteres developed. Discal areolet complete.

### Genus I. RHYPHUS.

RHYPHUS, Latr. Hist. Nat. Ins. xiv. 291 (1802); Meig.; Lam.; Mcq.; Curt.; Gimm.; Blanch. *Musca* p., L.; Gmel. *Tipula* p., F. Sp. Ins.; Scop. *Rhagio* p., F. Mant. Ins.; Mcig. Kl. *Sciara* p., F. Syst. Antl. *Anisopus*, Meig. Kl. Zw.

Corpus subcylindricum, sat gracile, non elongatum. Caput subrotundum. Labium elongatum, subcylindricum. Labrum lanceolatum. Lingua setiformis. Palpi 4-articulati, porrecti, compressi, pubescentes. Antennæ 16-articulatae, submoniliformes, pubescentes, thorace paullo breviores. Thorax ellipticus. Alæ sat longæ latæque. Abdomen cylindricum, segmentis septem, thorace duplo longius. Pedes graciles, vix elongati; tibiæ posticæ calcaribus minimis apicalibus. *Mas.* Oculi supra connexi. *Fæm.* Oculi disjuncti.

Body subcylindrical, rather slender, not long. Head nearly round. Ocelli three, in a triangle on the vertex. Labium fleshy, elongate, subcylindrical, with two cliptical hairy lobes. Labrum lancolate. Lingua setiform. Palpi four-jointed, porrect, compressed, pubescent; first joint subcylindrical; second broad, clavate, more than twice the length of the first; third and fourth slender; third not half the length of the fourth, which is about as long as the second. Antennæ sixteen-jointed, submoniliform, pubescent, rather shorter than the thorax; first joint longer than the others; the latter joints slightly attenuated. Thorax elliptical. Wings moderately long, and broad; subcostal vein ending at before two-thirds of the length of the wing; radial emerging from the subcostal at beyond half its length, ending at before three-fourths of the length of the wing, near which it is undulating; cubital forming a fork of the radial, and ending at very little in front of the

tip of the wing ; subapical ending at a little behind the tip ; præbrachial and pobrachial forked, the hind fork of the latter forming the subanal ; anal complete ; subaxillary nearly reaching the border. Areolets sixteen,—the humeral, the radical, the subcostal, two radial, the cubital, the præbrachial, the pobrachial, which is shorter than the præbrachial, the discal, four externo-medial, the anal, the axillary, and the subaxillary. Posterior margin much excavated at the base. Halteres moderately long. Abdomen cylindrical, with seven segments, about twice the length of the thorax. Legs slender, moderately long ; hind tibiæ with very minute apical spurs. *Male.* Eyes connected above. *Fem.* Eyes with a space between them.

The *Rhyphi*, like most other *Nemocera*, are gregarious in their aerial flight, and pair in the air. They feed on over-ripe fruit and on other vegetable substances. The larva inhabits dung ; it is cylindrical and very long ; the mouth contains two tentacular mandibles, and the tip of the abdomen has four short, very small, obtuse tubercles.

1. **nigricans**, L. F. S. 553. 2310 (1761) ; Blanch.—*fuscatus*, F. ; Gmel. ; Meig. ; Mcq. ; Gimm.—*fuscus*, Meig. Kl. *Cinereus*, antennis nigris, thorace vittis tribus nigris subcinereis *antice fusco maculatis*, abdomine vitta dorsali nigra suturis luridis, pedibus testaceis, femoribus tibiis tarsisque apice nigris. Long. 3–4 ; alar. 6–8 lin.

*Grey.* Antennæ black. Thorax with three broad black stripes. Wings greyish, with brown spots in front, none at the tip ; veins black, testaceous at the base. Halteres testaceous. Abdomen with a black dorsal stripe ; hind borders of the segments lurid. Legs testaceous ; tips of the femora, of the tibiæ, and of the tarsi, black.

Generally distributed ; pairs in the autumn. (E. S. I.)

2. **cinctus**, F. Sp. Ins. ii. 407. 41 (1781) ; Gmel.—*annulata*, L. —*fenestralis*, Scop. ; Latr. ; Meig. ; Lam. ; Curt. ! B. E. 102 ; Mcq. ; Guér. ; Gimm.—*nebulosus*, Meig. Kl.—*ochraceus*, Curt. *Testaceus*, capite antennisque nigris, thorace vittis tribus nigris, *alis* subcinereis *maculis anticis unaque apicali fuscis*, abdomine lurido fasciis nigricantibus, pedibus testaceis, femoribus tibiis tarsisque apice nigris. Long. 3–4 ; alar. 6–8 lin.

*Testaceous.* Head and antennæ black. Thorax with three black stripes. Wings greyish, with brown spots in front, and with one brown spot in front of each tip ; veins black, testaceous towards the base. Halteres testaceous. Abdomen lurid, with blackish bands. Legs testaceous ; tips of the femora, of the tibiæ, and of the tarsi, black.

Generally distributed ; frequents windows. (E. S. I.)

Genus I. OCHTHERA, ii. 249; Stnh.\*

1. **mantis**, ii. 250; Stnh.!; Ztt.; Lw.; Rdn.

Genus II. NOTIPHILA, ii. 250; Stnh.

1. **riparia**, ii. 251. 2; Stnh.; Ztt.—Antennæ with the second joint ferruginous; rays of the arista about fourteen. Abdomen distinctly spotted and freckled with black.

2. **cinerea**, ii. 251. 1; Stnh.!; Ztt.—Arista with about ten rays.

3. **uliginosa**, ii. 251. 3.—*tarsata*, Stnh.; Ztt.—Arista with about ten rays.

Genus III. DICHÆTA, ii. 251.—*Notiphila* p., Stnh.; Ztt.—*Keratocera* p., Desv.

1. **caudata**, ii. 251. 4; Stnh.; Ztt.—*nigra*, Desv.

Genus IV. DISCOMYZA, ii. 251; Stnh.; Ztt.

1. **incurva**, ii. 252. 5; Stnh.; Ztt.

2. **cimiciformis** (Curtis, MSS.), Nat. H. Rev. ii. 124 (1855).

Genus V. TRIMERINA, ii. 252.—*Psilopa* B, Stnh.; Zett.

1. **madizans**, ii. 252. 6; Stnh.; Ztt.—*nigella*, Mg.

Genus VI. PSILOPA (A), Stnh.†—*Hygrella*, ii. 252.—*Notiphila* p., Ztt.

1. **nitidula**, ii. 253. 7; Stnh.; Ztt.—Var. *compta*, Mg.

2. **leucostoma**, ii. 253. 8; Stnh.; Ztt.—*œstuans*?, L. fn. ii. 1870 (*antennis setariis*.)

Genus VII. DISCOCERINA, ii. 253.—*Clasiopa*, Stnh.

1. **obscurella**, Fln.; Stnh.; Ztt.—*nigrina*, var.  $\beta$ . ii. 253. 9.—Distinguished by the longer face, which is transversely gibbous in the middle, and inflected below, with a regular row of four stout bristles down each side, the orbit also being very minutely ciliated.

2. **nigrina**, Mg. ii. 253. 9.—var.  $\gamma$ . *cinerella*, Stnh.; Ztt.—The variety  $\alpha$  (ibid.), with the front above the antennæ and the face whitish, the third joint of the antennæ at the base beneath ferruginous, and the tarsi of a lighter colour, may be a distinct species. It is much rarer than the other form.

3. **pulicaria**, ii. 254. 11.—*fuscella*, Stnh.; Ztt.

4. **calceata**, ii. 253. 10.—*nigrina*, Stnh.; Ztt. Long.  $1\frac{1}{3}$ ; alar. 3 lin.

5. **glabra**, ii. 254. 12. Long.  $1\frac{1}{4}$ ; alar. 3 lin.

Genus VIII. HECAMEDE, ii. 254.—*Psilopa* p., Bohemann.

1. **albicans**, ii. 254. 13.—*globifera*, Bohemann, Act. Holm. 204 (1853).

Genus IX. HYDRELLIA, ii. 254; Stnh.—*Notiphila* p., Ztt.

1. **laticeps**, Stnh.! 229. 26; Ztt.—*cardamines* (major), ii. 255. 1, (deser. add.)

\* For the sake of uniformity the subgenera of Haliday and Stenhammar are treated here as genera.

† Stenhammar's application of the generic name *Psilopa*, though not to the original type, is adopted, to get rid of the synonym *Hygrella*, condemned on etymological grounds by Agassiz, not without reason. The different accent will admit *Psilöpa* to stand along with *Psilopus* (Fam. *Dolichopidae*, i. 150).

*Abdominis segmento quinto clongato; mas, hypopygio elongato subconico. Long. 1 $\frac{1}{4}$ ; alar. 3 lin.*

2. **flavilabris**, Stnh. 235. 31; Ztt.—*cardamines* (minor), ii. 255. 1. (deser. add.) *Abdominis segmentis subæqualibus; mas, quinto parum elongato, hypopygio brevi subtruncato. Long. 3 $\frac{3}{4}$ ; alar. 2 lin.*

3. **flaviceps**, ii. 225. 2.—*discolor*, Stnh.; Ztt.

4. **hydrocotyles**, ii. 256. 3. 5. **porphyrops**, ii. 256. 4.

6. **thoracica**, ii. 256. 5.—Obs. *H. cæsia*, Stnh., differs by the black tarsi.

7. **ranunculi**, ii. 256. 6.—*incana*, Stnh.; Ztt.

8. **griseola**, ii. 356. 7; Stnh.!; Ztt.

9. **chrysostoma**, ii. 257. 8.—*incana*, var. Stnh. 10. **tarsata**, ii. 257. 9.

11. **albiceps**, ii. 257. 10.—*plumosa*, Stnh.—*mutata*, Ztt.

12. **flavicornis**, Fln.; Stnh.—*erythrostoma*, ii. 257. 11.—*nigripes*, Ztt.

13. **cochleariae**, ii. 258. 12.

## PLATE XXI.

### FAMILY I. PULICIDÆ.

GENUS 1. **Pulex** (p. 1). Fig. 1. *Pulex irritans*, female. 1 *a*\*, mouth of *Pulex Canis*, with the parts separated: *md.* mandibles, *mx.* maxilla, (\* the thickened basal portion, † the thin apical portion,) *m.p.* the maxillary palpi, *t.* the tongue, *mn.* mentum, *lb.* labium, *l.p.* labial palpi; 1 *b*\*, end of one of the mandibles, showing the thickened horny and thinner hyaline edges, the marginal denticulations strongest on the former; 1 *c*\*, parts of the mouth, seen laterally, showing one maxilla and its palpus, one mandible and the labium with its pair of four-jointed palpi; 1 *d*\*, the same parts seen in another position; 1 *e*\*, maxilla with its palpus; 1 *f*\*, terminal joint of the tarsus of the middle leg, showing only one of the unguis, lobed at the base, somewhat as in the *Coriaceæ*, four rigid spines beneath, and several more slender ones round the tip; 1 *g*\*, the two unguis; 1 *h*\*, portion of one of the unguis, showing it to be obliquely but finely striated and crenated.

### FAMILY II. MYCETOPHILIDÆ.

GENUS 1. **Mycetophila** (p. 8). Fig. 2. *Mycetophila cingulum*. 2 *a*, face and antenna of ditto; 2 *b*, wing of *M. binotata*.

GENUS 2. **Cordyla** (p. 25). Fig. 3. *Cordyla crassicornis*, Meig. i. 275, n. 2. 3 *a*, antenna of ditto; 3 *b*, terminal joint of tarsus, with unguis and pulvillus.

GENUS 3. **Azana** (p. 26). Fig. 4. *Azana anomala*, Stæg. (*Scatopsoides*, Wlk.). 4 *a*, head seen in front; 4 *b*, ditto, sideways.

GENUS 4. **Leia** (p. 26). Fig. 5 *a*, wing of *Leia Winthemi*; 5 *b*, face of *L. trimaculata* (wing as in 5 *a*); 5 *c*, wing of *L. pulchella* (Curtis); 6, *L. brevicornis*, Zett. (= *Cordyla validula*, ante, p. 25, and *L. helvola*, ante, p. 31); 6 *a*, face of ditto; 6 *b*, anteuna of ditto.

(And see Plate XXIX. Fig. 1.)

GENUS 5. **Boletina** (p. 33). Fig. 7. *Boletina dubia*. 7 *a*, head of ditto, seen in front.

GENUS 6. **Sciophila** (p. 35). Fig. 8 *a*, face of *Sciophila fasciata*; 8 *b*\*, wing of *S. pictipennis* (omitting the fasciæ); 8 *c*\*, wing of *S. venosa* [Hal. ?], with the inner edge folded back.

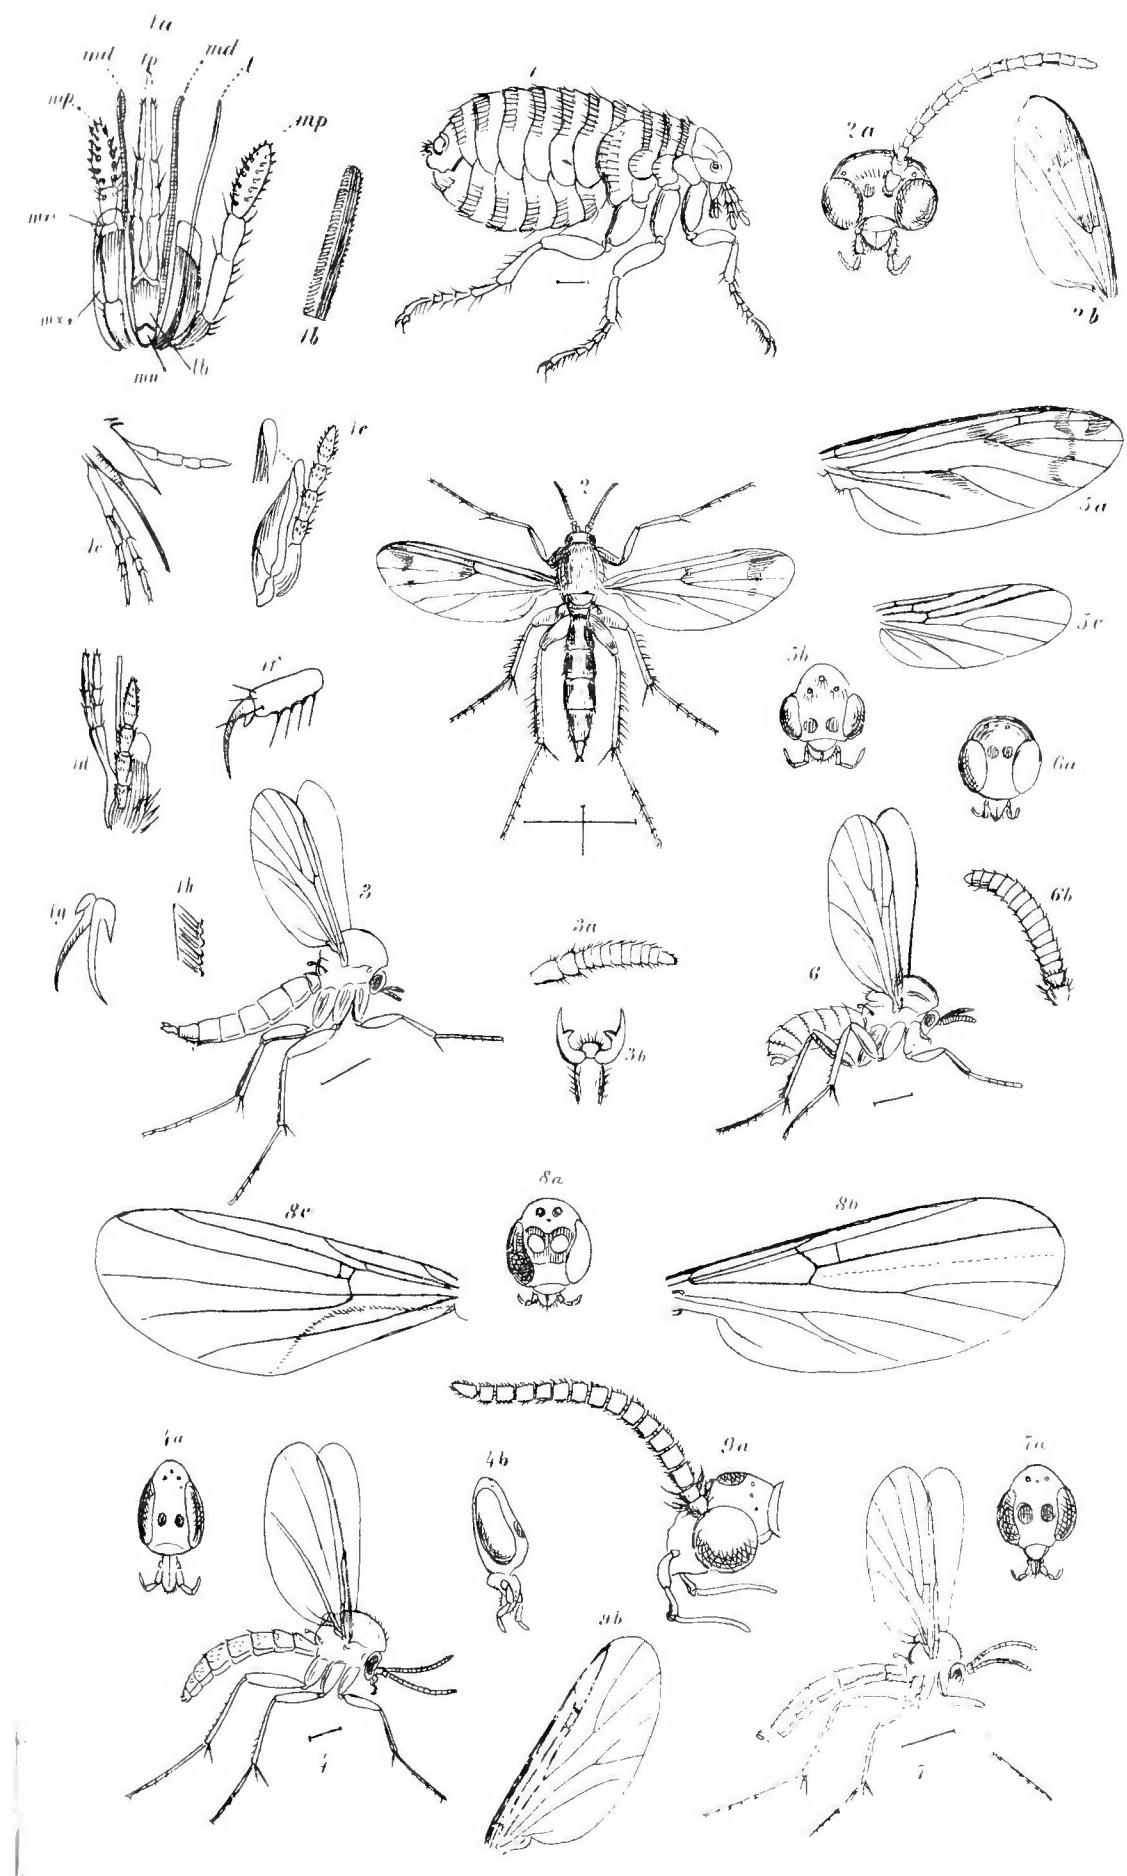

(And see Plate XXIX. Fig. 2.)

GENUS 7. **Tetragoneura** (p. 44). Fig. 9 *a*, head of *Tetragoneura* (Winnertz); 9 *b*\*, wing of *T. sylvatica*.

J. O. W

The figures indicated by a \* have been communicated by A. H. Haliday, Esq.

### FAMILY II. MYCETOPHILIDÆ (*continued*).

GENUS 8. **Asindulum** (p. 46). Fig. 1\* *Asindulum flavum*. 1 *a*, head and antenna of ditto, seen sideways (Wz.); 1 *b*, ditto, seen in front (Wz.).

(And see Plate XXIX. Fig. 4.)

GENUS 9. **Leptomorphus** (p. 48). Fig. 2 *a*, head and antenna of *Leptomorphus Walkeri*, seen sideways (Curtis); 2 *b*, ditto, seen from above; 2 *c*, middle leg of ditto; 2 *d*, wing of ditto (Curtis).

GENUS 10. **Diadocidia** (p. 48). Fig. 3. *Diadocidia ferruginosa*. 3 *a*, head, and 3 *b*, palpus of ditto (Wz.).

GENUS 11. **Mycetobia** (p. 49). Fig. 4 *a*, antenna of *Mycetobia pallipes*; 4 *b*, hind leg of ditto; 4 *c*\*, wing of ditto; 4 *d*, head, seen obliquely; and 4 *e*, palpus of ditto (Wz.).

(And see Plate XXIX. Fig. 3.)

GENUS 12. **Sciara** (p. 50). Fig. 5 *a*, head of *Sciara* —? seen in front (Meig.); 5 *b*\*, wing of *Sciara Thomæ*.

(And see Plate XXX. Fig. 3.)

GENUS 13. **Epidapus** (p. 56). Fig. 6. *Epidapus venaticus*. 6 *a*\*, body of ditto, seen sideways.

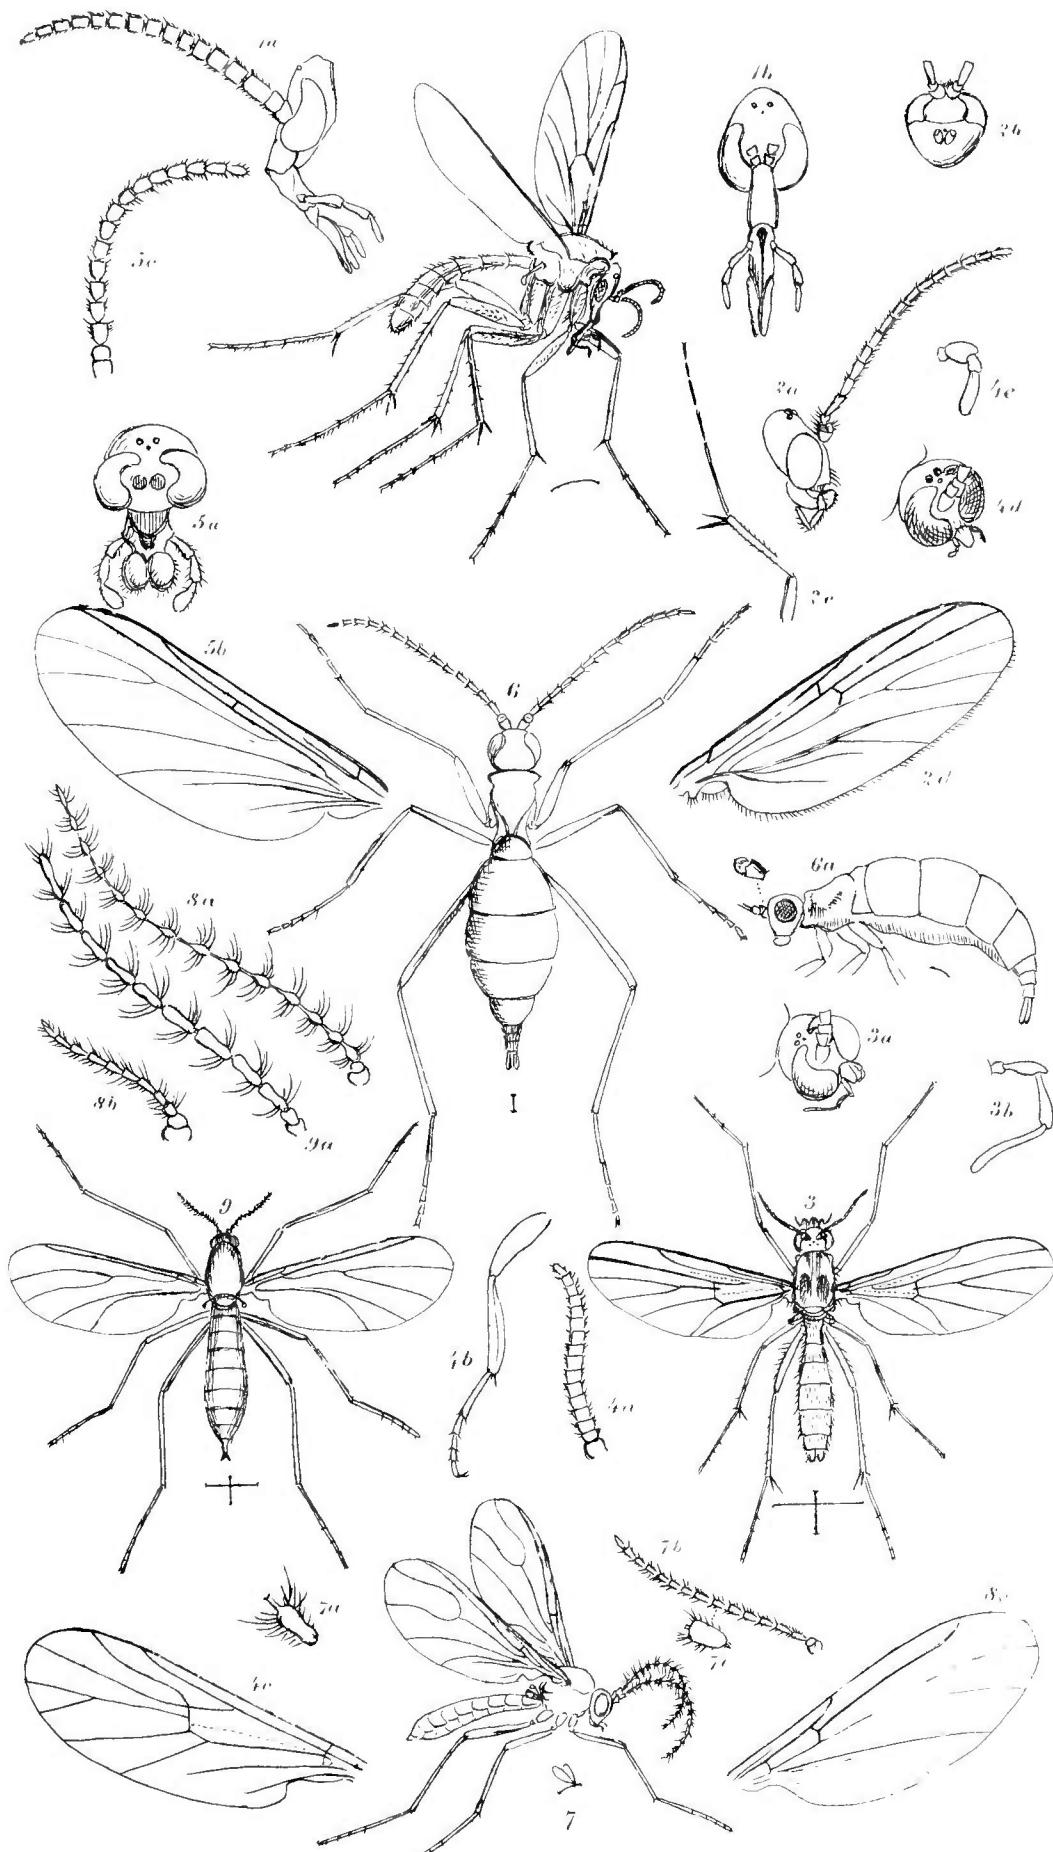

GENUS 14. **Zygoneura** (p. 57). Fig. 7. *Zygoneura sciarina*, male. 7 *a*, one of the middle joints of the antenna; 7 *b*, antenna of female; 7 *c*, one of the middle joints of ditto.

GENUS 15. **Lestremia** (p. 57). Fig. 8 *a*, antenna of *Lestremia cinerea*, male; 8 *b*, antenna of female; 8 *c*, wing.  
(And see Plate XXIX. Fig. 7.)

GENUS 16. **Cecidogona** (p. 58). Fig. 9. *Cecidogona carnea*, female. 9 *a*, antenna of male.

### FAMILY VIII. PHLEBOTOMIDÆ.

GENUS 1. **Psychoda** (p. 254). Fig. 1 *a*, wing of *Psychoda sexpunctata* (Curtis); 1 *b*\*, head of ditto, seen from below; 1 *c*\*, apex of proboscis opened by pressure, *m.*, maxilla; 1 *d*\*, ditto more pressed open, *m.*, maxilla and base of palpus; 1 *e*\*, maxilla and base of palpus; 1 *f*\*, labium; 1 *g*\*, labium; 1 *h*\*, bivalved oviscapts (the tentacles of the vagina); 1 *i*\*, one of the joints of the antenna of male and base of another joint.

GENUS 2. **Pericoma** (p. 256). Fig. 2 *a*, front of head of a species of this genus (Curtis).

GENUS 3. **Ulomyia** (p. 261). Fig. 3 *a*, wing of *Ulomyia hirta*, male; 3 *b*, ditto of female.

GENUS 4. **Trichomyia** (p. 261). Fig. 4. *Trichomyia urbica*, male.

GENUS 5. **Sycorax** (p. 262). Fig. 5 *a*\*, wing of *Sycorax silacea*. (And see Plate XXX. Fig. 1.)

### FAMILY IX. HETEROCLITÆ.

GENUS 1. **Orphnephila** (p. 264). Fig. 6. *Orphnephila testacea*, male. 6 *a*\*, antenna of ditto; 6 *b*\*, mouth of ditto.

GENUS 2. **Dixa** (p. 266). Fig. 7. *Dixa maculata*. 7 *a*, antenna of ditto (Curtis).

### FAMILY X. TIPULIDÆ.

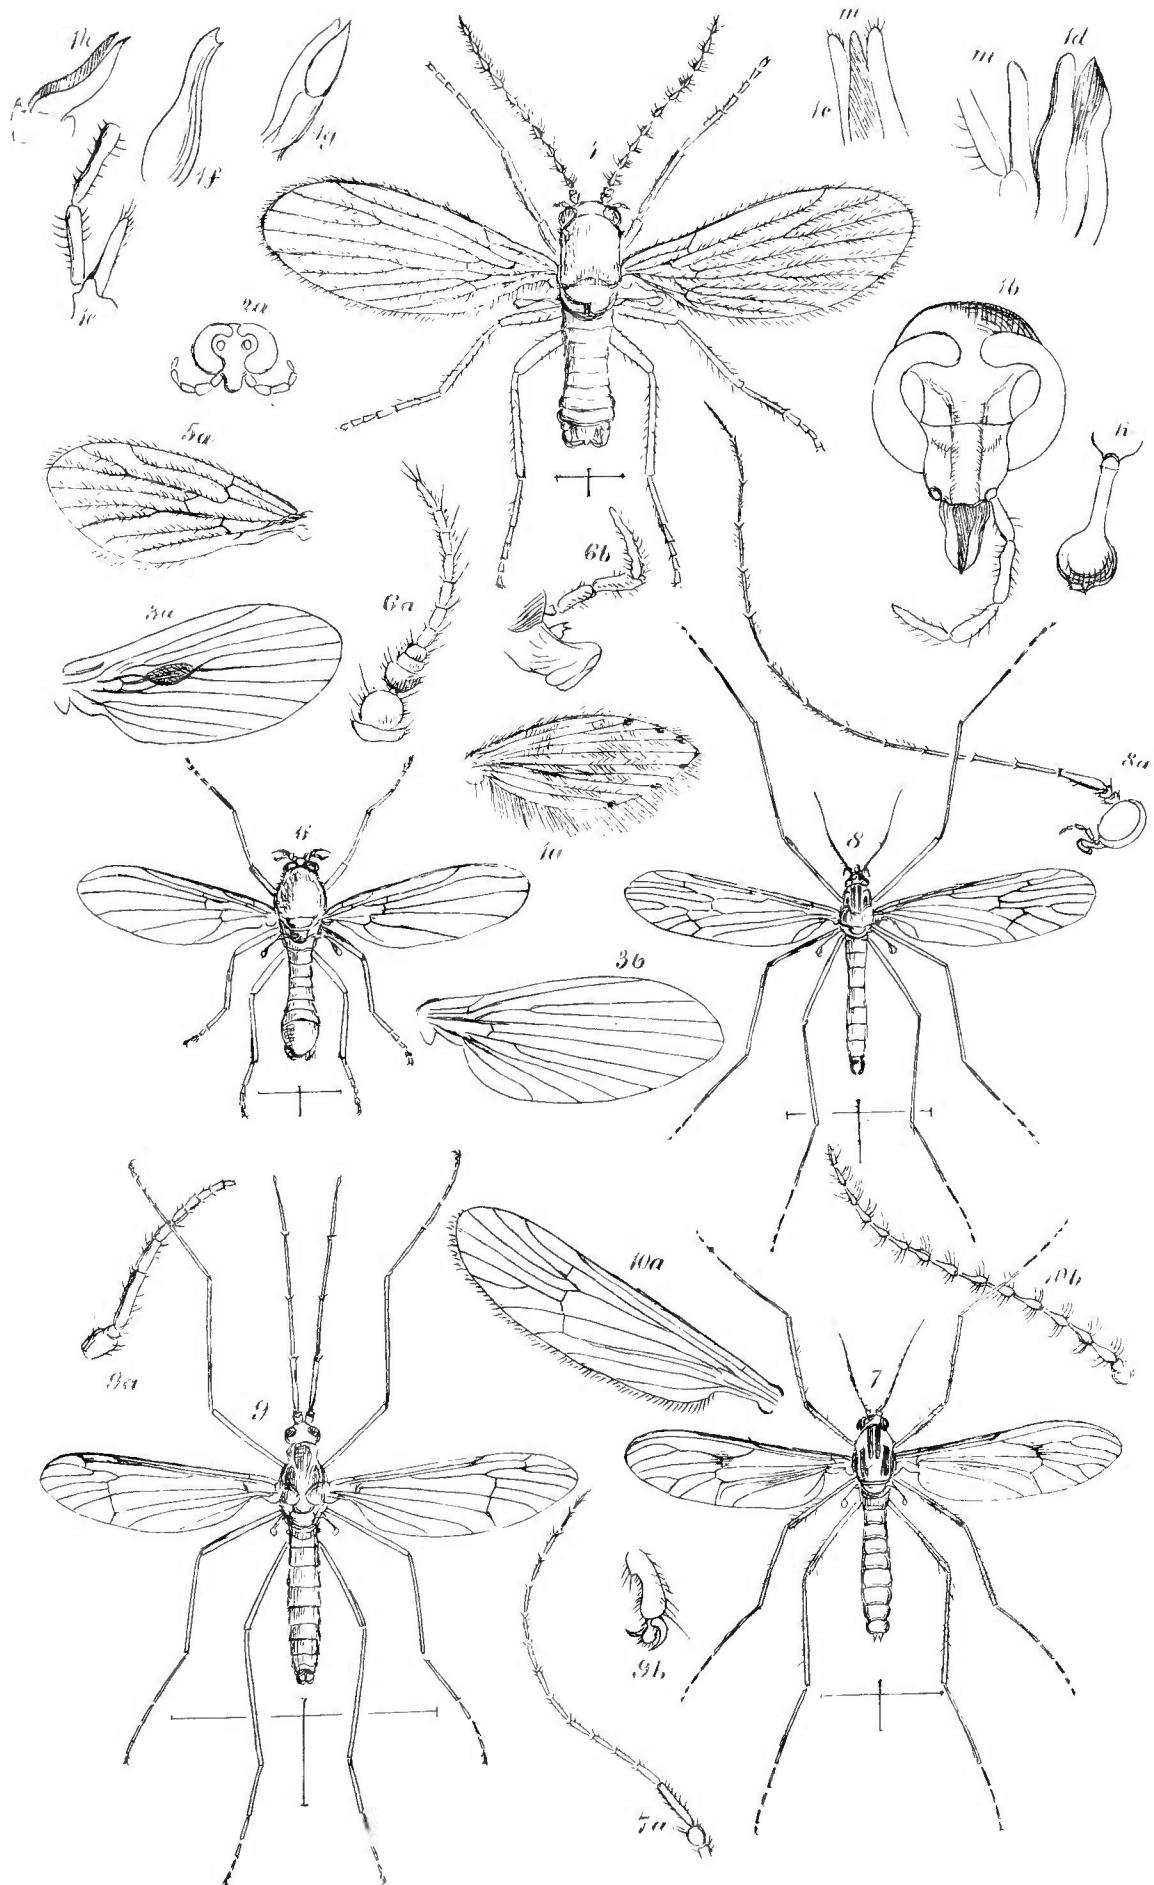

GENUS 1. **Trichocera** (p. 270). Fig. 8. *Trichocera hiemalis*, male. 8 *a*, antenna drawn from a living specimen, and certainly 16-jointed.

GENUS 2. **Anisomera** (p. 272). Fig. 9. *Anisomera nigra*, male. 9 *a*, antenna of female of ditto (10-jointed); 9 *b*, last joint of all the tarsi, emarginate beneath; (between Figures 9 and 7.)

GENUS 3. **Erioptera** (p. 273). Fig. 10 *a*, wing of *Erioptera flavescens* (Curtis); 10 *b*, antenna of ditto (Curtis). (And see Plate XXX. Fig. 9.)

### FAMILY II. MYCETOPHILIDÆ (*continued*).

GENUS 4. **Leia** (p. 26). Fig. 1. *Leia trimaculata*.  
(And see details in Plate XXI. Fig. 5.)

GENUS 6. **Sciophila** (p. 35). Fig. 2. *Sciophila hilaris*.  
(And see details in Plate XXI. Fig. 8.)

GENUS 11. **Mycetobia** (p. 49). Fig. 3. *Mycetobia pallipes*; 3 a, extremity of hind tibia, showing the minute spurs; 3 b, terminal joint of tarsus and unguis.  
(And see details in Plate XXII. Fig. 4.)

GENUS 8. **Asindulum** (p. 46). Fig. 4, wing of *Asindulum flavum*.  
(And see figure in Plate XXII. Fig. 1.)

### FAMILY IV. BIBIONIDÆ (*continued*).

GENUS 1. **Bibio** (p. 134). Fig. 5. *Bibio Marci*, male.  
(And see details in Plate XXIV. Fig. 3.)

### FAMILY VI. CHIRONOMIDÆ (*continued*).

GENUS 4. **Ceratopogon** (p. 205). Fig. 6. *Ceratopogon femoratus*, Fab.; Winn.=*C. palustris*, Latreille (Steph. Ill. pl. 42, fig. 3). 6 a, antenna of male; 6 b, wing; 6 c, extremity of hind tarsus; 6 d, 6 e, 6 f, 6 g, terminal joint of tarsus and unguis of various sections of *Ceratopogon* (Winnertz).  
(And see figure and details in Plate XXV. Fig. 4.)

### FAMILY II. MYCETOPHILIDÆ (*continued*).

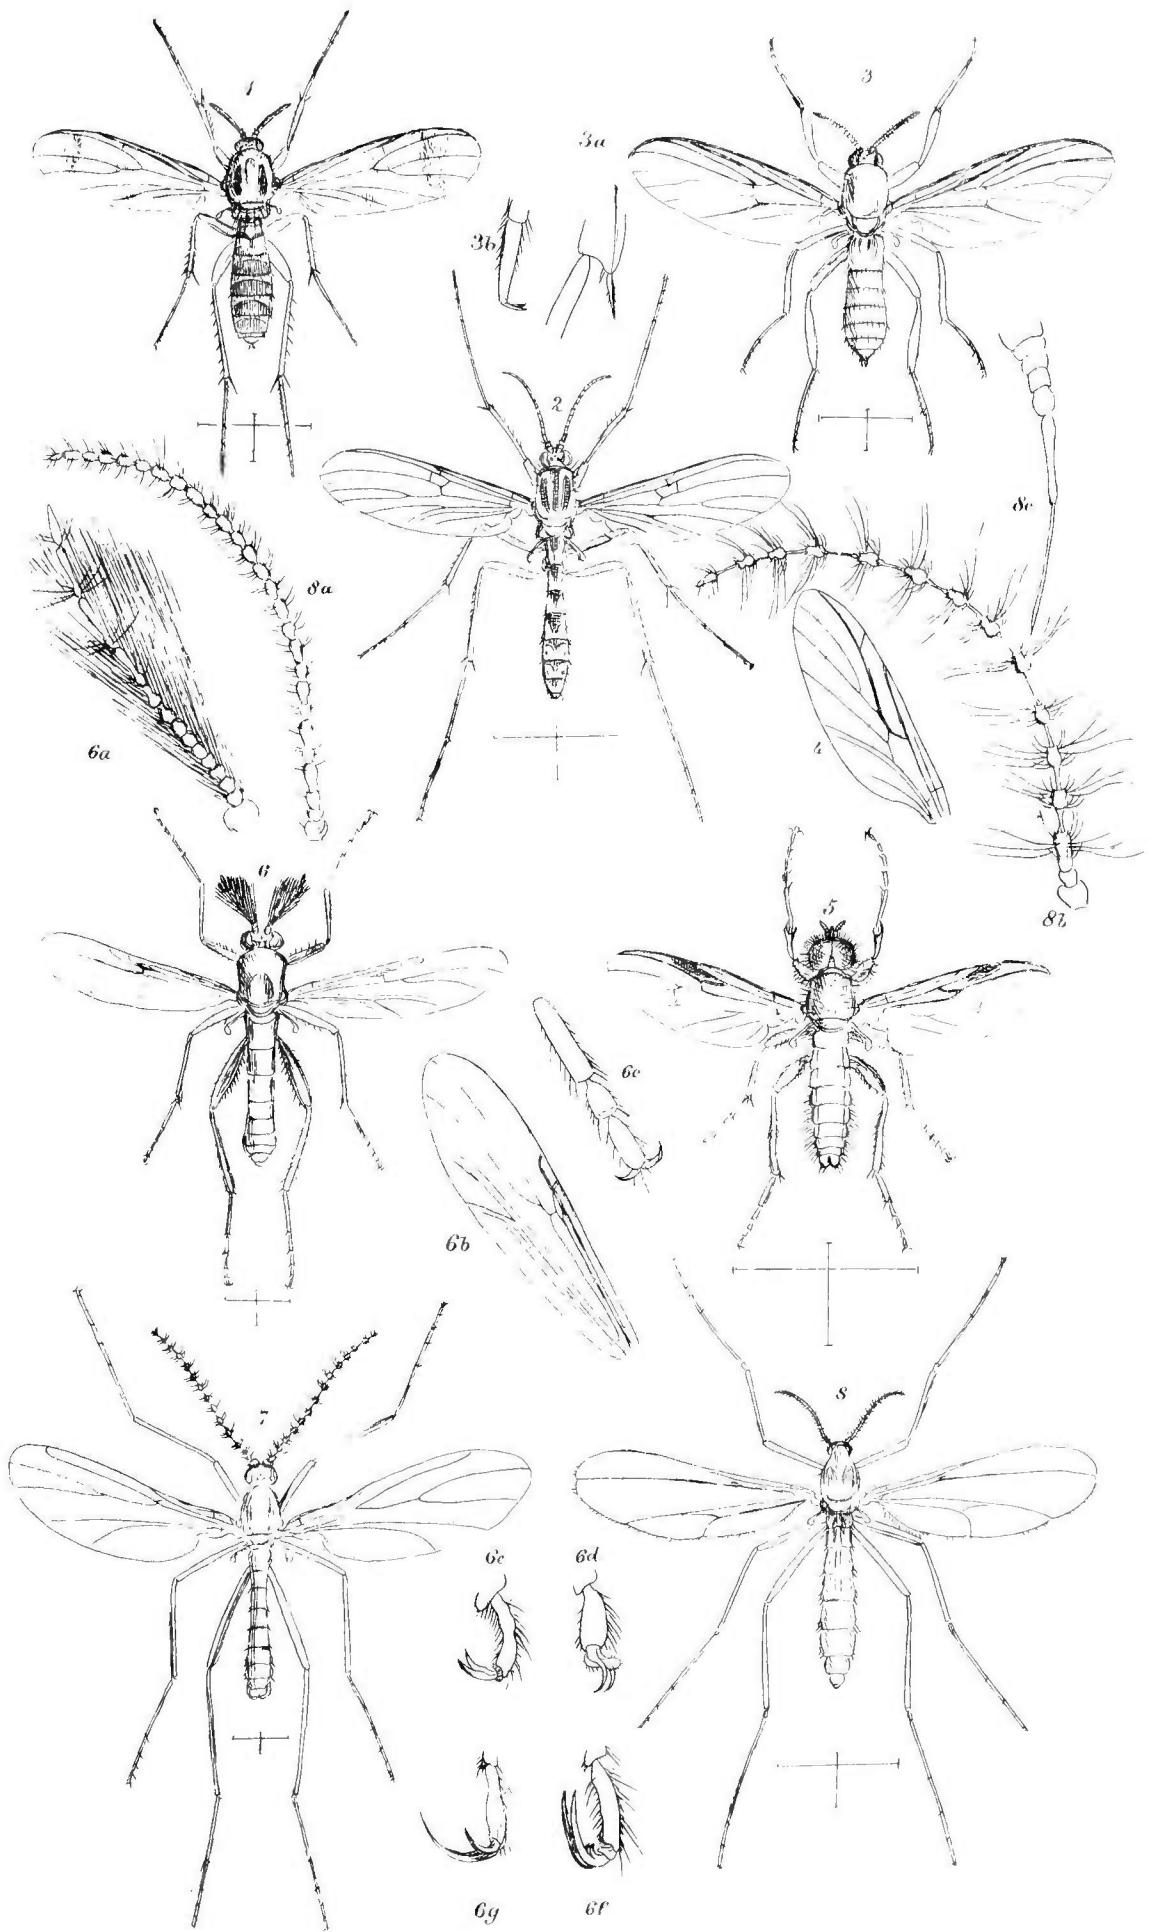

GENUS 15. **Lestremia** (p. 57). Fig. 7. *Lestremia leucophaea*, male.  
(And see details in Plate XXII. Fig. 15.)

### FAMILY III. CECIDOMYZIDÆ (*continued*).

GENUS 1. **Cecidomyia** (p. 73). Fig. 8. *Cecidomyia* (*Hormomyia*) *fasciata* (in Mus. A. H. Haliday). 8 a, antenna of ditto; 8 b, antenna of *Cecidomyia* (*Epidosis*) *gracilis*, male (Winnertz); 8 c, extremity of abdomen of *Cecidomyia* (*Diplosis*) *digitata* (Winnertz).  
(And see figure and details in Plate XXIV. Fig. 1.)

### FAMILY VIII. PHLEBOTOMIDÆ (*continued*).

GENUS 5. **Sycorax** (p. 262). Fig. 1. *Sycorax silacea*,\* male.  
(And see Plate XXVI. Fig. 5 a.)

### FAMILY III. CECIDOMYZIDÆ (*continued*).

GENUS 2. **Lasioptera** (p. 132). Fig. 2. *Lasioptera Rubi*, female.  
2 a, antenna of ditto (Winnertz).  
(And see Plate XXIV Fig. 2, and details.)

### FAMILY II. MYCETOPHILIDÆ (*continued*).

GENUS 12. **Sciara** (p. 50). Fig. 3. *Sciara Thomæ*, female.  
(And see details in Plate XXII. Fig. 5.)

### FAMILY VI. CHIRONOMIDÆ (*continued*).

GENUS 1. **Chironomus** (p. 149). Fig. 4. *Chironomus plumosus*, male.  
(And see figure and details in Plate XXV Fig. 1.)

### FAMILY VII. CULICIDÆ (*continued*).

GENUS 1. **Culex** (p. 243). Fig. 5. *Culex annulatus*, male.  
(And see Plate XXV. Fig. 7 for details.)

### FAMILY X. TIPULIDÆ (*continued*).

GENUS 17. **Ptychoptera** (p. 337). Fig. 6, head of *Ptychoptera contaminata*.  
(And see Plate XXVIII. Fig. 7.)

GENUS 6. **Dicranota** (p. 305). Fig. 7 a, wing of *Dicranota pavida*,\*  
7 b, ditto of *D. bimaculata*, Schumm. tab. 4, f. 1.  
(And see Plate XXVII. Fig. 3.)

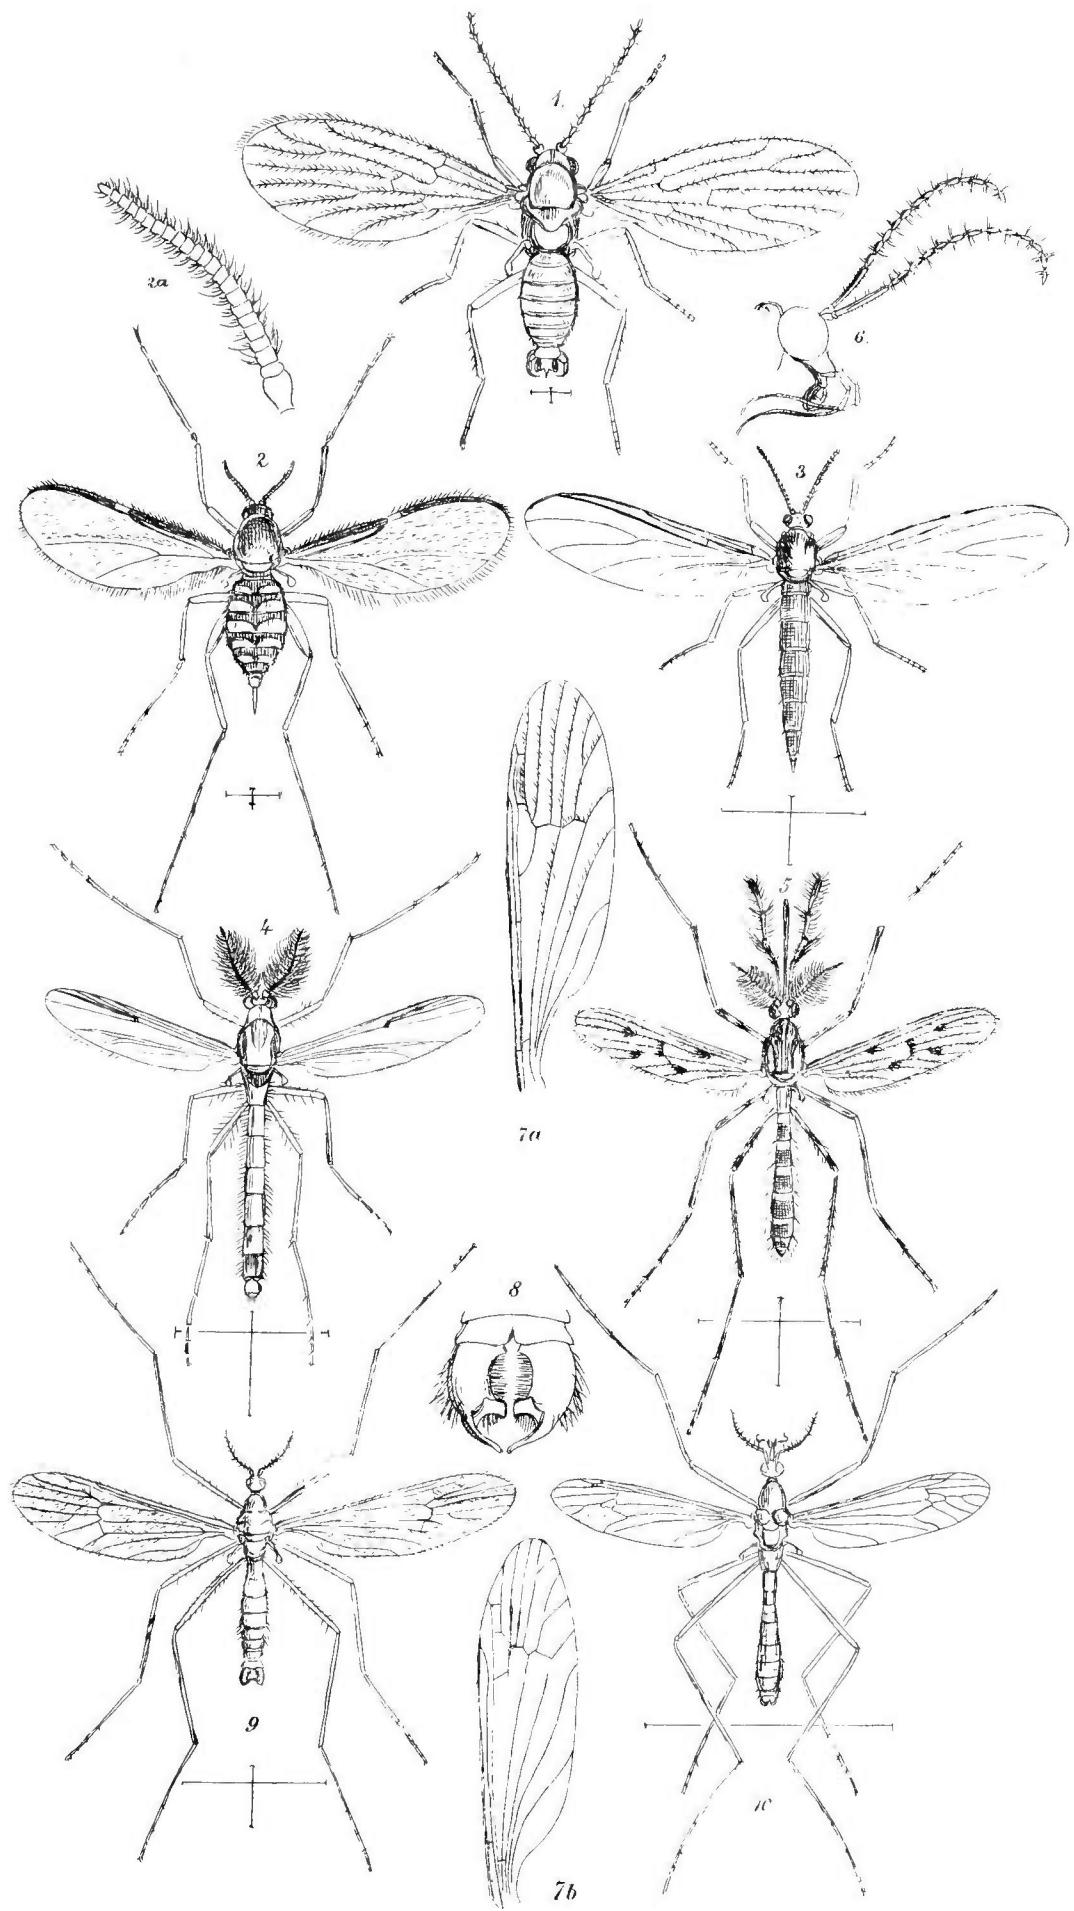

GENUS 12. **Pedicia** (p. 314). Fig. 8, extremity of abdomen of *Pedicia venosa*, male.  
(And see figure and details in Plate XXVIII. Fig. 2.)

GENUS 3. **Erioptera** (p. 273). Fig. 9. *Erioptera lineata*, male.  
(And see details in Plate XXVI. Fig. 10.)

GENUS 15. **Tipula** (p. 318). Fig. 10. *Tipula pagana*, male.  
(And see Plate XXVIII. Fig. 5 for figure of female and details of  
the genus.)

J. O. W.

DITIERA, Pl.XXX.

5, HENRIETTA STREET, COVENT GARDEN,  
LONDON, March 31st, 1856.

MR. REEVE'S  
LIST OF PUBLICATIONS.

1.

Sir Edward Belcher, C.B.

*The Last of the Arctic Voyages,*

During the Years 1852–4, in H. M. S. Assistance, under the command of Captain Sir E. Belcher, C.B., F.R.G.S.; with Notes on the Natural History, by Sir J. Richardson, Professor Owen, Thomas Bell, J. W. Salter, and Lovell Reeve. With numerous coloured plates, charts, and wood-engravings.

Royal 8vo, 2 vols., price 36s.

[Ready.]

2.

Adam White, F.L.S.

*Popular History of Birds,*

With 20 coloured plates. By ADAM WHITE, F.L.S.

Royal 16mo, price 10s. 6d.

[Ready.]

3.

Dr. Daubeny, F.R.S.

*Popular Geography of Plants;*

Or, a Botanical Excursion round the World. By E. M. C. Edited by CHARLES DAUBENY, M.D., F.R.S., Professor of Botany in the University of Oxford. With 20 tinted landscapes in chromo-lithography.

Royal 16mo, price 10s. 6d.

[Ready.]

4.

Dr. Seemann, F.L.S.

*Popular History of the Palms.*

With 20 tinted landscapes in chromo-lithography. By DR. BERTHOLD SEEMANN, F.L.S.

Royal 16mo, price 10s. 6d.

[Just ready.]

## 5.

**T. C. Archer.**

*A Series of Eight School Plant Diagrams,*

Illustrative of 'First Steps to Economic Botany,' by T. C. ARCHER, Esq. Published for the Department of Science and Art, Marlborough House.

Price 3s. 6d. coloured, 2s. plain, per Diagram.

## 6.

**T. C. Archer.**

*First Steps to Economic Botany;*

A Description of the Botanical and Commercial Characters of the Chief Articles of Vegetable Origin used for Food, Clothing, Tanning, Dyeing, Building, Medicine, Perfumery, etc. For the use of Schools. By THOMAS C. ARCHER. With 20 plates. Published for the Department of Science and Art, Marlborough House.

Royal 16mo, price 2s. 6d.

"An admirable and cheap little volume, abounding in good illustrations of the plants that afford articles of food or applicable to purposes of manufacture. This should be on the table of every family, and its contents familiar with all rising minds." ATLAS.

"As a cheap school book it is exceedingly well got up, and contains upwards of one hundred beautifully lithographed drawings, arranged on twenty plates; they represent various useful plants and their products." GUARDIAN.

## 7.

**T. C. Archer.**

*Popular Economic Botany;*

Or, Description of the Botanical and Commercial Characters of the principal Articles of Vegetable Origin used for Food, Clothing, Tanning, Dyeing, Building, Medicine, Perfumery, etc. By THOMAS C. ARCHER. With 20 coloured plates.

Royal 16mo, price 10s. 6d.

"Mr. Archer's volume, we are surprised to find, is the first popular book that has been devoted exclusively to the commercial products of the Vegetable Kingdom—of that which constitutes nine-twelfths of the whole commerce in raw produce."

EXAMINER.

---

8.

**Miss Catlow.**

*Popular Garden Botany;*

Containing a Familiar and Technical Description of Hardy and Frame Plants, suitable for cultivation in the Garden. By AGNES CATLOW. With 20 coloured plates by W. Fitch.

Royal 16mo, price 10s. 6d.

[Ready.]

---

9.

**Thomas Moore, F.L.S.**

*Popular History of British Ferns*

and the Allied Plants ; comprising the Club Mosses, Pepperworts, and Horsetails. By THOMAS MOORE, F.L.S., Curator of the Botanic Garden, Chelsea. *Second Edition.* With 22 coloured plates by Fitch.

Royal 16mo, price 10s. 6d.

[Ready.]

---

10.

**Miss Catlow.**

*Popular Field Botany;*

Containing a familiar and technical Description of the Plants most common to the British Isles, adapted to the study of either the Artificial or Natural System. By AGNES CATLOW. *Third Edition.* In twelve chapters, each being the botanical lesson for the month. With 20 coloured plates.

Royal 16mo, price 10s. 6d.

a 2

## 11.

Sir W. J. Hooker, F.L.S.

*Curtis's Botanical Magazine;*

Comprising the Plants of the Royal Gardens of Kew, and of other Botanical Establishments in Great Britain, with suitable Descriptions. By Sir W. J. HOOKER, F.L.S., Director of the Royal Gardens of Kew. In Numbers, each containing 6 coloured plates.

Royal 8vo. Published Monthly. Price 3s. 6d.

Vols. I. to XI., price 42s. each.

## 12.

Sir W. J. Hooker, F.R.S.

*Journal of Botany and Kew Miscellany;*

Containing Original Papers by eminent Botanists, the Botanical News of the Month, Communications from Botanical Travellers, Notices of New Books, etc. Edited by Sir W. J. HOOKER, F.R.S. With plates.

In Monthly Numbers, 8vo, price 2s.

## 13.

Sir W. J. Hooker, F.R.S.

*Icones Plantarum;*

Or, Figures, with brief descriptive Characters and Remarks, of new and rare Plants, selected from the Author's Herbarium. By Sir W. J. HOOKER, F.R.S. New Series, Vol. V., with 100 plates.

8vo, price 31s. 6d.

---

14.

## *Notes and Notions on Created Things.*

First and Second Series. By the Author of '*Episodes of Insect Life.*'  
With numerous wood-engravings.

12mo, price 5s. each Series.

"We cannot imagine a book that would take a deeper hold of the imagination."  
ATHENÆUM.

---

15.

**Dr. Hooker, F.R.S.**

## *The Rhododendrons of Sikkim-Himalaya;*

Being an Account of the Rhododendrons recently discovered in the  
Mountains of Eastern Himalaya. By J. D. HOOKER, M.D., F.R.S.  
With 30 plates by W. Fitch.

Imperial folio, price £3. 16s.

---

16.

**Dr. Hooker, F.R.S.**

## *Illustrations of Sikkim-Himalayan Plants,*

Chiefly selected from Drawings made in Sikkim under the superintendence of the late J. F. Cathcart, Esq., Bengal Civil Service. The  
Botanical Descriptions and Analyses by J. D. HOOKER, M.D., F.R.S.  
With 24 coloured plates by Fitch, and an illuminated title-page.

Folio, price £5. 5s.

17

**Professor Edward Forbes, F.R.S.***Literary Papers on Scientific Subjects.*

By the late Professor EDWARD FORBES, F.R.S. Selected from his Writings in the 'Literary Gazette.' With a Portrait and Memoir.

Small 8vo, price 6s.

"This reprint of reviews forms a charming book of miscellaneous essays. The criticism is genial, sensible, comprehensive, and compact. It is not common to find eminent scientific men graceful, easy, and piquant *littérateurs*; but whenever such a union of claims to public favour is manifested, it should meet with honour due. But, besides being a scientific professor, a critic, and *littérateur*, the late Edward Forbes was before all things a man—genial, sympathetic, brave, and true—a thorough good fellow, as good a fellow as he was a naturalist. The reader cannot do better than possess himself of this amusing and instructive volume, if he have a liking for science without solemnity, criticism without ill-nature, and with knowledge of the subject; pleasant talk with a definite result, and a sense of the comic without the vulgar error of turning all things to a jest."

GLOBE.

18.

**Sir W. J. Hooker, F.R.S.***The Victoria Regia.*

By Sir W. J. HOOKER, F.R.S. With four coloured plates by Fitch.

Elephant folio, price 21s.

19.

**Dr. Badham.***The Esculent Funguses of England;*

Containing an Account of their Classical History, Uses, Characters, Development, Structure, Nutritious Properties, Modes of Cooking, etc. By the Rev. Dr. BADHAM. With 20 coloured plates.

Super-royal 8vo, price 21s.

20.

**Dr. Landsborough, A.L.S.***Popular History of British Seaweeds;*

Comprising their Structure, Fructification, Specific Characters, Arrangement, and General Distribution, with Notices of some of the Fresh-water Algæ. By the Rev. D. LANDSBOROUGH, A.L.S. *Second Edition.* With 20 coloured plates by Fitch.

Royal 16mo, price 10s. 6d.

"The book is as well executed as it is well timed. The descriptions are scientific as well as popular, and the plates are clear and explicit. It is a worthy sea-side companion—a handbook for every resident on the sea-shore." ECONOMIST.

21.

**Professor Harvey, M.R.I.A.***Phycologia Britannica;*

Or, History of the British Seaweeds ; containing coloured Figures and Descriptions of all the Species of Algæ inhabiting the Shores of the British Islands. By WILLIAM HENRY HARVEY, M.D., M.R.I.A., Keeper of the Herbarium of the University of Dublin, and Professor of Botany to the Dublin Society. With 360 plates.

In three vols. royal 8vo, arranged in the order of publication	£7 12 6
---	---------

In four vols. royal 8vo, arranged systematically according to the Synopsis	£7 17 6
---	---------

*A few Copies have been printed on large paper.*

"The drawings are beautifully executed by the author himself on stone, the dissections carefully prepared, and the whole account of the species drawn up in such a way as cannot fail to be instructive, even to those who are well acquainted with the subject. The greater part of our more common Algæ have never been illustrated in a manner agreeable to the present state of Algology." GARDENERS' CHRONICLE.

## 22.

**Professor Harvey, M.R.I.A.**

*Nereis Australis;*

Or, Illustrations of the Algæ of the Southern Ocean. Being Figures and Descriptions of Marine Plants collected on the Shores of the Cape of Good Hope, the extra-tropical Australian Colonies, Tasmania, New Zealand, and the Antarctic Regions. By Professor HARVEY, M.D., M.R.I.A. Two Parts, each containing 25 coloured plates.

Imperial 8vo, price £1. 1s.

## 23.

**J. Sanders.**

*Treatise on the Culture of the Vine,*

As well under Glass as in the Open Air. By J. SANDERS. With 9 plates.

8vo, price 5s.

"We have examined, with no common interest, the work before us; for it will be strange indeed if a man who can act so skilfully as Mr. Sanders should be unable to offer advice of a corresponding value. We have not been disappointed. Mr. Sanders's directions are as plain as words can make them, and, we will add, as judicious as his long experience had led us to expect."

GARDENERS' CHRONICLE.

## 24.

**Dr. Seemann, F.L.S.**

*Botany of the Voyage of H.M.S. Herald,*

Under the command of Captain Kellett, R.N., C.B., during the years 1845–51. By Dr. BERTHOLD SEEMANN, F.L.S. Published under the authority of the Lords Commissioners of the Admiralty. In Parts, each with 10 plates.

Royal 4to, price 10s. each Part.

25.

**Dr. Hooker, F.R.S.***Flora of New Zealand.*

By JOSEPH DALTON HOOKER, M.D., F.R.S., etc. In 2 volumes  
With 130 Plates.

Royal 4to, price £12. 12s. coloured, £8. 15s. plain.

"The work is written in good plain English, with a view to the conveniency of colonists, but without on that account being rendered in the smallest degree unscientific; quite the contrary. Let us add, that the beautiful execution of the work renders it a library-book, even for those who are not interested about natural history."

GARDENERS' CHRONICLE.

26.

**Dr. Hooker, F.R.S.***Flora Antarctica;*

Or, Botany of the Antarctic Voyage of H.M. Discovery Ships Erebus and Terror, in the years 1839-43, under the command of Captain Sir J. C. Ross, F.R.S. By Dr. HOOKER, F.R.S. Published under the authority of the Lords Commissioners of the Admiralty. With 200 plates.

2 vols. royal 4to, price £10. 15s. coloured, £7. 10s. plain.

"The descriptions of the plants in this work are carefully drawn up, and much interesting matter, critical, explanatory, and historical, is added in the form of notes. The drawings of the plants are admirably executed by Mr. Fitch; and we know of no productions from his pencil, or, in fact, any botanical illustrations at all, that are superior in faithful representation and botanical correctness."

ATHENÆUM.

27

**Dr. Hooker, F.R.S.***Cryptogamia Antarctica;*

Or, Cryptogamic Botany of the Antarctic Voyage of H.M. Ships Erebus and Terror. Issued separately. With 72 plates.

Royal 4to, price £4. 4s. coloured, £2. 17s. plain.

---

28.

**R. M. Stark.**

*A Popular History of British Mosses,*

Comprising a General Account of their Structure, Fructification, Arrangement, and General Distribution. By R. M. STARK, Esq. With 20 coloured plates.

[Just published.]

Royal 16mo, price 10s. 6d.

"Mr. Stark has given as full and instructive an account of our wild Mosses as can well be desired. It is founded avowedly upon the long labours of Sir William Hooker in the same direction, and this alone guarantees the soundness of the author's systematic views. All the genera and species of 'Moss,' as that term is understood by botanists, are clearly but succinctly described in the English language; and to aid the learner in understanding the subject, we find twenty coloured plates admirably executed by Mr. Fitch. When we add that the work has a good index, the reader will require no further assurance that it deserves to be strongly recommended."

GARDENERS' CHRONICLE.

"'Popular British Mosses' is the best book we have seen upon the subject. The plates are exquisite, and do justice to the grace and delicacy of the originals."

GUARDIAN.

---

29.

**Miss Roberts.**

*Voices from the Woodlands;*

Descriptive of Forest Trees, Ferns, Mosses, and Lichens. By MARY ROBERTS. With 20 coloured plates by Fitch.

Royal 16mo, price 10s. 6d.

"The fair authoress of this pretty volume has shown more than the usual good taste of her sex in the selection of her mode of conveying to the young interesting instruction upon pleasing topics. She bids them join in a ramble through the sylvan wilds; and at her command the fragile liehen, the gnarled oak, the towering beech, the graceful chestnut, and the waving poplar, discourse eloquently, and tell their respective histories and uses."

BRITANNIA.

---

30.

**Joseph Woods, F.L.S.**

*The Tourist's Flora;*

A Descriptive Catalogue of the Flowering Plants and Ferns of the British Islands, France, Germany, Switzerland, and Italy. By JOSEPH WOODS, F.L.S. With a plate.

8vo, price 18s.

---

31.

Mrs. Hussey.

*Illustrations of British Mycology;*

Or, Figures and Descriptions of the Funguses of interest and novelty indigenous to Britain. By Mrs. HUSSEY.

Royal 4to. First Series, 90 coloured plates, price £7. 12s. 6d. ;  
Second Series, 48 plates, price £4. 2s. 6d.

"This is an elegant and interesting book: it would be an ornament to the drawing-room table; but it must not, therefore, be supposed that the value of the work is not intrinsic, for a great deal of new and valuable matter accompanies the plates, which are not fancy sketches, but so individualized and life-like, that to mistake any species seems impossible. The accessories of each are significant of site, soil, and season of growth, so that the botanist may study with advantage what the artist may inspect with admiration."

MORNING POST.

---

32.

Sir W. J. Hooker, F.R.S.

*A Century of Orchidaceous Plants.*

The Plates selected from Curtis's Botanical Magazine. The Descriptions re-written by Sir W. J. HOOKER, F.R.S., Director of the Royal Gardens of Kew; with Introduction, and Instructions for their Culture, by JOHN CHARLES LYONS. 100 coloured plates.

Royal 4to, price £5. 5s.

"In the exquisite illustrations to this splendid volume, full justice has been rendered to the oddly formed and often brilliantly coloured flowers of this curious and interesting tribe of plants."

WESTMINSTER AND FOREIGN QUARTERLY REVIEW.

---

33.

**Henry Sowerby.**

*Popular Mineralogy;*

Comprising a familiar Account of Minerals and their Uses. By HENRY SOWERBY. With 20 coloured plates.

Royal 16mo, price 10s. 6d.

"Mr. Sowerby has endeavoured to throw around his subject every attraction. His work is fully and carefully illustrated with coloured plates."      *SPECTATOR.*

---

34.

**Adam White, F.L.S.**

*Popular History of Mammalia;*

Containing a familiar Account of their Classification and Habits. By ADAM WHITE, F.L.S., of the British Museum. With sixteen coloured plates of Quadrupeds, by B. WATERHOUSE HAWKINS, F.L.S.

Royal 16mo, price 10s. 6d.

"The present increase of our stores of anecdotal matter respecting every kind of animal has been used with much tact by Mr. White, who has a terse chatty way of putting down his reflections, mingled with easy familiarity, which every one accustomed daily to zoological pursuits is sure to attain. The book is profusely illustrated."

ATLAS.

---

35.

**Francis Walker, F.L.S., and H. T. Stainton.**

*Insecta Britannica;*

Vols. I. and II., Diptera. By FRANCIS WALKER, F.L.S. With 20 plates. Vol. III., Lepidoptera. Tineina. By H. T. STAINTON. With 10 plates.

8vo, price 25s. each.

36.

**Miss M. E. Catlow.***Popular British Entomology;*

Containing a familiar and technical Description of the Insects most common to the British Isles. By MARIA E. CATLOW. *Second Edition.* In twelve chapters, each being the entomological lesson for the month. With 16 coloured plates.

Royal 16mo, price 10s. 6d.

"Judiciously executed, with excellent figures of the commoner species, for the use of young beginners." ADDRESS OF PRESIDENT OF THE ENTOMOLOGICAL SOCIETY.

"Miss Catlow's 'Popular British Entomology' contains an introductory chapter or two on classification, which are followed by brief generic and specific descriptions in English of above 200 of the commoner British species, together with accurate figures of about 70 of those described; and will be quite a treasure to any one just commencing the study of this fascinating science."

WESTMINSTER AND FOREIGN QUARTERLY REVIEW.

37

**John Curtis, F.L.S.***Curtis's British Entomology;*

Being Illustrations and Descriptions of the Genera of Insects found in Great Britain and Ireland, containing coloured figures, from nature, of the most rare and beautiful species, and, in many instances, of the plants upon which they are found.

Commenced in 1824 and completed in 1840, in 193 numbers, forming 16 volumes, price £43. 16s. Now offered to Subscribers, new and in the best condition, with 770 coloured plates, at £21.

Re-issued also in Monthly Parts, price 3s. 6d.

Vols. I. to V. of the Re-issue now ready, price 42s. each.

"Vous savez qu'à l'égard d'un grand nombre d'espèces, leur détermination réclame le secours de figures. Il est donc de mon devoir de vous indiquer les livres où vous trouverez les meilleures. Celui de M. Curtis, sur les genres d'insectes indigènes de l'Angleterre, me paraît avoir atteint l'*ultimatum* de la perfection."—LATREILLE.

"M. John Curtis, naturaliste Anglais, a commencé la publication d'un *Genera iconographique* des genres d'insectes et de plantes propres à la Grande Bretagne. Leurs caractères y sont représentés avec la plus grande fidélité."—CUVIER.

## 38.

**G. B. Sowerby, F.L.S.**

*Popular British Conchology;*

Containing a familiar History of the Molluscs and Shells inhabiting the British Isles. By G. B. SOWERBY, F.L.S. With 20 coloured plates.

[Just published.]

Royal 16mo, price 10*s.* 6*d.*

"Mr. G. B. Sowerby maintains the character of his father and grandfather as a naturalist, and has here produced a very instructive volume as an introduction to the study of shells. This work belongs to Mr. Reeve's illustrated series on Popular Natural History, and is a worthy companion to some of the latter volumes, of the value and interest of which we have spoken when they were published. It will be seen by the title that this work is confined to British shells. It will be found a most convenient handbook at the sea-side, as all the more common shells are not only described, but illustrated. It will serve as an admirable introduction to the great work on 'British Mollusca,' by the late Edward Forbes and Mr. Hanley."

ATHENÆUM.

## 39.

**Lovell Reeve, F.L.S.**

*Elements of Conchology;*

Comprising the Physiological History of Shells and their Molluscous Inhabitants; their Structure, Geographical Distribution, Habits, Characters, Affinities, Arrangement, and Enumeration of Species. By LOVELL REEVE, F.L.S. Parts 1 to 10, with 50 coloured plates.

Royal 8vo, price 3*s.* 6*d.* each.

"The work before us is designed to promote a more philosophical spirit of inquiry into the nature and origin of Shells."

ECCLESIASTICAL REVIEW.

## 40.

**Lovell Reeve, F.L.S.**

*Conchologia Systematica;*

Or, Complete System of Conchology; in which the Lepades and Conchiferous Mollusca are described and classified according to their Natural Organization and Habits. By LOVELL REEVE, F.L.S. Illustrated with 300 plates of upwards of 1500 figures of Shells.

Two vols. 4to, price £10 coloured, £6 plain.

41.

Lovell Reeve, F.L.S.

*Conchologia Iconica;*

Or, Figures and Descriptions of the Shells of Molluscous Animals, with Critical Remarks on their Synonyms, Affinities, and Circumstances of Habitation. By LOVELL REEVE, F.L.S. Published Monthly in Parts, demy 4to, each containing eight plates, price 10s.

[Part 148 just published.

Genus just ready:—NERITINA.

"This great work is intended to embrace a complete description and illustration of the shells of molluscous animals; and so far as we have seen, it is not such as to disappoint the large expectations that have been formed respecting it. The figures of the shells are all of full size: in the descriptions a careful analysis is given of the labours of others: and the author has apparently spared no pains to make the work a standard authority on the subject of which it treats."

ATHENÆUM.

~~~~~

42.

**Miss Roberts.**

*Popular History of the Mollusca;*

Comprising a familiar Account of their Classification, Instincts, and Habits, and of the Growth and Distinguishing Characters of their Shells. By MARY ROBERTS. With 18 coloured plates by Wing.

Royal 16mo, price 10s. 6d.

"The authoress is already favourably known to British naturalists by her 'Conchologist's Companion,' and by other works on natural history. We expected to find in it a useful and entertaining volume. We have not been disappointed. The work is illustrated with eighteen plates, beautifully coloured—in most instances affording a view of the structure of the animal."

ATHENÆUM.

~~~~~

43.

**P. H. Gosse.**

*Popular British Ornithology;*

Containing a familiar and technical Description of the Birds of the British Isles. By P. H. GOSSE. *Second Edition.* In twelve chapters, each being the ornithological lesson for the month. With 20 coloured plates.

Royal 16mo, price 10s. 6d.

"To render the subject of ornithology clear, and its study attractive, has been the great aim of the author of this beautiful little volume. . It is embellished by upwards of seventy figures of British birds beautifully coloured." MORNING HERALD.

---

44.

**Miss Catlow.**

*Drops of Water;*

Their marvellous and beautiful Inhabitants displayed by the Microscope. By AGNES CATLOW. With 4 coloured plates.

Square 12mo, price 7s. 6d.

"An elegant little book, both in the getting up and its literature. The text is accompanied by coloured plates that exhibit the most remarkable creatures of the watery world."

*SPECTATOR.*

"Of the manner in which this work is executed, we can say that, like Miss Catlow's previous productions on natural history, it displays an accurate acquaintance with the subject, and a keen delight in the contemplation of the objects to which it is devoted. As far as the living beings which inhabit 'Drops of Water' are concerned, we know of no better introduction to the use of the microscope than the present volume."

*ATHENÆUM.*

---

45.

**Dr. Landsborough, A.L.S.**

*Popular History of British Zoophytes;*

By the Rev. D. LANDSBOROUGH, A.L.S., Member of the Wernerian Society of Edinburgh. With 20 coloured plates.

Royal 16mo, price 10s. 6d.

"This work constitutes one of the popular series of scientific treatises which, from the simplicity of their style, and the artistic excellence and correctness of their numerous illustrations, has acquired a celebrity beyond that of any other series of modern cheap works. With this manual of Zoophytes, and that upon Seaweeds, by the same author, the student can ramble along the sea-shores, and glean knowledge from every heap of tangled weed that lies in his pathway."

*LIVERPOOL STANDARD.*

---

50.

**J. Beete Jukes, F.G.S.**

## *Popular Physical Geology.*

By J. BEETE JUKES, F.G.S., President of the Geological Society of Dublin. With 20 Landscapc Views of Geological Scenery in Double-Tinted Lithography.

Royal 16mo, price 10s. 6d.

"Mr. Jukes's 'Popular Physical Geology' is peculiarly remarkable for the skilful treatment of his subject. The established facts and principles of geology are not only presented with freshness, but so clearly enforced and illustrated as to impress the mind of the student, while he is stimulated to observation by the facility with which he is shown that observation can be made."

*SPECTATOR.*

"The illustrations to the work are of the most accurate as well as beautiful character, combining the skill of the artist with the knowledge of the geologist."

*OBSERVER.*

53.

**Chandos Wren Hoskyns.**

***Talpa; or, the Chronicles of a Clay Farm.***

An Agricultural Fragment. By CHANDOS WREN HOSKYNS. New and Cheaper Edition, with Frontispiece by George Cruikshank.

Fcp. 8vo, price 3s. 6d.

"The writer handles this subject in such a masterly manner—his style is so piquant, as well as forcible, so scholarly, yet so racy—his wit and his wisdom are so skilfully blended—he has so cleverly worked out his motto, *Ridentem dicere verum*, by telling the truth laughingly—that the reader finds himself irresistibly carried along, and he and the book part not company until he has made himself master of the tale that he has to unfold."

LEICESTERSHIRE MERCURY.

"This is a rare little volume. We don't know which to admire most, the author's humour or his wisdom. He has set himself the task of illustrating, in an agreeable manner, the evils of custom, prejudice, and feudalism, as they exist among agriculturists. It will create much laughter among the merry, and convey many a lesson to the tiller of the soil. There are some very capital illustrations, too, embellishing the volume."

ERA.

"Cleverly written in a vein of pleasantry, the work perseveringly uproots the prejudice of the past, and demonstrates that scientific knowledge is an important element in successful tillage."

LINCOLN MERCURY.

---

54.

**Piscarius.**

***The Artificial Production of Fish.***

By PISCARIUS. *Third Edition.*

Price 1s.

"The object of this little book is to make known the means by which fish of all descriptions may be multiplied in rivers to an almost incalculable extent. . . . This principle of increase Piscarius has carried out by argument and experiment in his little treatise, which, we think, is worthy the attention of the legislator, the country gentleman, and the clergyman; for it shows how an immense addition may be made to the people's food with scarcely any expense."

ERA.
